Extremely Randomized Trees (ERT) is an extension of the RF algorithm that uses a different method for selecting the splits. ERT selects splitting point at random within a predefined range, rather than searching for the optimal split point based on the impurity measure. The use of random subsamples and random feature selection helps to reduce the variance of the model and prevent overfitting [7]. ERT is also robust against the changing size and noise in the data. The table below compares the performance of ERT with other popular ensemble learning algorithms. The comparison uses iris, wine, glass and yeast dataset.

Table 3.2 Comparison of ERT with other ensemble learning algorithms [6]

Algorithm	**Classification Accuracy**	**Regression RMSE**
ERT	95.9%, 98.1%, 72.4%, 62%	0.041, 0.042, 0.065, 0.174
Random Forest	94.7%, 97.2%, 70.7%, 58.3%	0.049, 0.055, 0.068, 0.197
AdaBoost	95.8%, 97.2%, 69.1%, 50.2%	0.047, 0.064, 0.071, 0.262
Bagging	94.7%, 97.2%, 69.1%, 58.1%	0.052, 0.058, 0.072, 0.198

Direct impurity is a generally used measure of feature importance, however it does not account for the contribution of each feature. SHAP values, in contrast, more accurately reflect human intuition, consistently assign feature importance, and better retrieve influential features. We transform SHAP values in tree ensembles into a workable replacement for previous feature significance methods [8] by introducing the first polynomial time approach for them. The difference between the expected output of the model with the feature included and the predicted output of the model with the feature deleted, averaged over all potential subsets of features, is the SHAP value for a specific feature. In order to account for the interactions between the features, it measures each feature's contribution to the model's prediction.

3. LightGBM

LightGBM is an open-source gradient boosting framework that is designed to efficiently handle datasets and deliver accurate predictions. A histogram-based approach is used by LightGBM to split data and generate decision trees. This makes it efficient when used for computing split points and reduces memory usage [15]. Generally speaking, LightGBM and XGBoost are recognised to be quicker and more effective than one another, especially when working with smaller datasets. The training process is accelerated by LightGBM using a histogram-based method, which can be very helpful when working with datasets that include a limited number of unique feature values. As opposed to LightGBM, XGBoost is a more conventional gradient boosting technique that makes use of pre-sorted sparse data structures and has the potential to be memory-efficient.

Table 3.3 Comparison of XGBoost, LightGBM and CatBoost on various parameters.[9] [10] [11] [12]

Feature	**XGBoost**	**LightGBM**	**CatBoost**
Tree construction	Level-wise	Leaf-wise	Leaf-wise
Histogram Based	No	Yes	Yes
Categorical features	One-hot encoding	Native support	Native support
GPU acceleration	Yes	Yes	Yes
Parallel learning	Yes	Yes	Yes
Multi-class	SoftMax	One-vs-all	Ordered boosting
Missing values	Yes	Yes	Yes
Speed	Medium	Fast	Medium-Fast
Memory Usage	Medium	Low	Medium-Low
Regularization	L1,L2	L1, L2	L1,L2, Random
Embedding Support	No	Yes	Yes

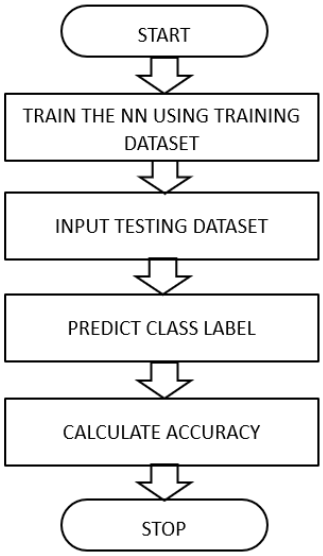
4. Neural Networks

Artificial neural networks (ANNs) are a family of statistical learning models inspired by biological neural networks, and they are used to estimate or approximate functions that can depend on a large number of inputs and are generally unknown. ANNs are presented as systems of interconnected "neurons" that exchange messages with each other. The connections between neurons have numeric weights that can be tuned based on experience, making neural nets adaptive to inputs and capable of learning. Backpropagation is a common method of training artificial neural networks used in conjunction with an optimization method such as gradient descent. The method calculates the gradient of a loss function with respect to all the weights in the network and updates the weights to minimize the loss function. Backpropagation is a supervised learning method that requires a known, desired output for each input value in order to calculate the loss function gradient. The backpropagation learning algorithm can be divided into two phases: propagation and weight update. During propagation, the input is forwarded through the neural network to generate the output activations, and then the output activations are backward propagated through the neural network using the training pattern target to generate the deltas of all output and hidden neurons. During weight update, for each weight-synapse, the output delta and input activation are multiplied to get the gradient of the weight, and a ratio of the gradient is subtracted from the weight.[8]

This process is repeated until the performance of the network is satisfactory. The learning rate, or the ratio of the gradient, influences the speed and quality of learning. A higher learning rate makes the neuron train faster, while a lower learning rate makes the training more accurate. Five steps were considered for the implementations including the- Designing a Neural Network, Creating/Gathering training Data sets; Thermometer Encoding; Training the Neural Network; Testing the Neural Network against Random data [8] For the designing step, A neural network has been designed using Backpropagation algorithm which is a supervised learning algorithm. Backpropagation works by approximating the non-linear relationship between the input and the output by adjusting the weight values internally. [13] The next few steps include finding the appropriate data set and then before feeding to the neural network, the data is then encoded into binary format to

make it easier to work with. Supervised training method is both the inputs and the outputs are provided. The network then processes the inputs and compares its resulting outputs against the desired outputs. Errors are then propagated back through the system, causing the system to adjust the weights which control the network. This process occurs over and over as the weights are continually tweaked. A limiting value is set so that the training stops reaching the limit. A learning rate is initialized which is set to either low (if the dataset is variable and large) or high (if the dataset is small). Once the training part is completed, the network is given random sets of data as input. The network will classify the given input into the appropriate group/class based on how effectively the network is trained. The network will be 80- 90% accurate in classifying the random sets of data. [13]

Fig 3.4. Flowchart for data mining using the Backpropagation method. [8]



IV. CONCLUSION

In conclusion, the use of prediction classification algorithms is crucial for achieving accurate and efficient results when working with big data. The algorithms discussed in this literature review, including the improved Apriori algorithm, ERT, LightGBM, and ANNs, have shown promising results in various benchmarks and applications. However, it is essential to select the appropriate algorithm based on the specific data and problem at hand. With the rapid growth of big data, prediction classification algorithms will continue to play a significant role in various fields, including healthcare, finance, and marketing.

V. ACKNOWLEDGMENT

We would like to express our sincere gratitude to our mentor, Dr. Sheetal Rathi, for her invaluable guidance and motivation throughout the preparation of this paper. Her extensive knowledge and expertise in the field of data mining has been a valuable resource for our team, and we have greatly appreciated her insights and feedback at every step of the process. Her encouragement and support have been instrumental in helping us to bring this project to fruition, and we are deeply grateful for her contributions to our learning and development. We would also like to thank the rest of our colleagues and friends who have provided their support and encouragement throughout this project.

Abstract: **Though there have been significant advancement happening in digital technology, the processing of cheques still require significant human intervention. This process is tedious and takes couple of days for actual transfer of money which involves verification by the intermediaries. This leads to high time and costs. In this paper, the methodology and associated technology of an automated cheque processing system is discussed. The processing includes - extracting relevant details on a bank cheque like Payee Name, Amount, Date, Bank Name using Optical Character Recognition and Deep Learning and verifies the signature on the cheque with the existing signature stored in the database using feature extraction and principal component analysis. The signature for a new user is stored using it's hash value for security purposes. The efficiency and performance is measured on the self-generated data set of bank cheques.**

Keywords - ***Optical Character Recognition, Machine Learning, CNN , Deep Learning.***

I. INTRODUCTION

With digital innovations happening across the world in all sectors, it becomes crucial for every industry to automate their processes to attain better performance and efficiency for any model. Banking and financial industry plays a crucial role since large number of transactions occur in the form of bank cheques. A Cheque is one of the most predominant reports of a bank where being duplicated is greatest. Cheques are the excessively delighted non-cash payment method with about 96.8 billion dollars worthy worldwide in 2018. The use of paper checks has been on the decline since the early 2000s, but a large portion of the population still relies on these physical check transactions.

Nowadays, consumers want to clear their checks without waiting for hours or days — which is why they prefer digital transactions because they are more convenient and fast-paced. As a result, financial institutions and banks now use automated banking check clearing systems to fast-track check payments. Automated check processing follows the same working principle as physical check clearing. The only difference is that the process is automated. The withdrawal bank sends a digital copy of the cheque, accompanied by data on the MICR band.

The automated system of processing cheque includes extracting and recognition of handwritten and typed information such as payee name, amount, account number, date, cheque number, signature. The signature is extracted and verified with the original signature of the account holder stored in the database of the drawer bank. If the signature is not matched, the system displays an error message. The primary goal of the system is to develop a accurate model which reads the handwritten texts like name of the payee, date and amount in the cheque with the least possible error and then processes the extracted data and performs transaction in encrypted format which maintains security

II. LITERATURE SURVEY

In the past, systems have been developed to extract hand-written texts using either by traditional CNN[1] or by feature extraction using SVM[2] or by extracting texts using Optical Character Recognition. The accuracy of OCR on handwritten texts is significantly low hence it cannot be used for high end character recognition. The method makes use of Computer Vision to extract texts much efficiently compared to

either simply using any of the above mentioned techniques. Also, there have been no implementation in automating the entire process of cheque clearance till date which performs extraction of data elements as well as does transaction in back-end. The system assumes certain bank templates and accordingly matches credentials of corresponding banks and then does transaction using encrypted algorithm SHA-256[3].

In this paper[4] a method for signature verification, which is based on Perception and Probability. It means first the system roughly determines to which class a signature belongs to and then it finally decides whether the signature can be accepted or not. Perception presents the class, which a signature "possibly" belongs and the pattern classification based on state transition determines if at all it belongs to that class. Beside it defines an accurate closeness function. They have proposed such a system where it combine the spatial features of sum graph and HMM and classify them separately by a PNN Knowledge based classifier. In this paper [5], cheque is a payment instrument that requires high-cost processing in banks because it involves significant manual works. The usage of cheque still exists as an important non- cash payment instrument, even though Bank Negara Malaysia has imposed a new processing fee of RM0.50 per cheque since 2015. In this paper, they have proposed a digit recognizer where manual input of payee's account number and cheque amount by the customer will be ceased to simplify the manual process at the cheque deposit machine. In the proposed method [6] verifies a cheque by identifying and examining the account holder's signature. The signature extraction goes through image acquisition, gray scale image translation, binary image extraction, which is localized, segmented. The implementation involves the image extraction and extracted image is divided into characters are going to be localized. The localized data is compared with the collected database which is already collected from the given database. This method is implemented using offline mode, thereby allowing portability. This paper gives effective sign algorithm and also provides a security by manual checking In the proposed system[7] they can detect handwritten digits from scanned input image by using neural network technique is presented. This methodology of recognition of hand writing is effective and fast compared to earlier molded image pixel comparison methodology, which is comparatively very slow. In the initial phase, hand writing samples are collected from different people and designed a form for handwritten digit input.

I. METHODOLOGY

The following methodology was put forward in a research paper published in JETIR July 2021 (Volume 8, Issue 7 AUTOMATED CHEQUE PROCESSING SYSTEM).

The image acquisition of a bank cheque is crucial for the CTS (Cheque Truncating System). Generally, flatbed scanners are used to acquire such images. Due to orientation and irregularities preseted in the scanned image(s), As the system is unable to use the acquired image(s) directly for the image processing operations therefore it requires some pre-processing step. Image pre-processing Image [preprocessing is a technique used to scan cheque images. As a scanned image obtained from the scanner cannot be directly used thus it is in need of pre-processing, which involves two primary operations, i.e, rotation and removal of unnecessary background information. In first step, scanned image is rotated with respect to the 'Date Box' (is a common feature presented at the same part of every bank cheque) and then removed the background noise and extra information. Efficiency of the parameter identification considerably improves with removal of extra background information. Rotation As the scanned images may vary in terms of orientation therefore the date box which was present in all standard cheque leaflets was used and the relative invariant nature of the position was utilized. In order to perform the rotation of image, It is determined that the point of rotation and degree of rotation. The primary component essential for rotation to work was contour extraction, as it was possible to determine the position values of date box by using it which used as our anchor for any set of operation related to length mapping. Also, in order to perform the rotation, the midpoint of the image was used as the rotation point, and date box was used in order to determine the angle necessary for the rotation. Removing background noise There was lot of extra information in an original image which is to be removed. For the task of removing of background information, the date box is used to present in the standard cheque template.

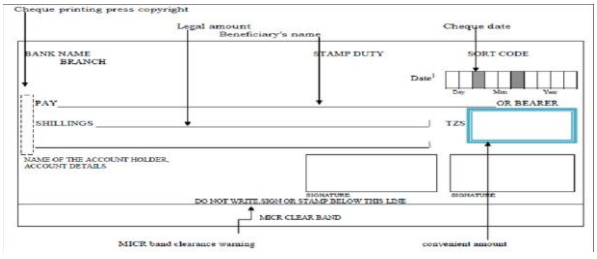

Fig 1. General Cheque layout

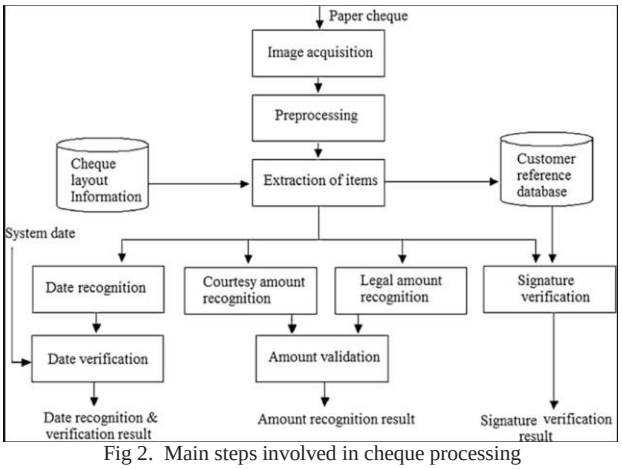

Fig 2. Main steps involved in cheque processing

I. RESULTS AND DISCUSSION

In terms of limitations, we found that there were still some challenges associated with the implementation of automated cheque processing systems. For example, the need for effective security measures to prevent fraud and ensure data privacy, as well as the need for standardization and interoperability between different systems, were identified as key issues. Despite these limitations, the results of our study indicate that automated cheque processing has the potential to play a significant role in modernizing the banking industry and improving the customer experience. Further research is needed to address these limitations and refine the technology to ensure that it can be effectively adopted on a large scale.

Additionally, it is important to note that while the results of our study are promising, further research is necessary to fully understand the long-term impact of automated cheque processing on the banking industry.

For instance, it will be important to monitor the costs and benefits of implementing these systems, and to understand how they may change the role of bank employees. Moreover, it is important to consider the potential social and ethical implications of these systems, such as the impact on employment in the banking sector and the need for measures to ensure that technology is accessible and usable for all customers.

II. CONCLUSION

In conclusion, automated cheque processing is a vital component of modern banking systems that has the potential to significantly improve the efficiency and accuracy of cheque clearing processes. By leveraging technology such as optical character recognition and machine learning algorithms, automated cheque processing systems are able to automate many manual tasks, reduce errors, and provide real-time access to cheque information.

However, despite the many benefits of automated cheque processing, there are still some challenges that must be addressed. For example, there are concerns about the security and accuracy of automated systems, as well as the need for

standardization and interoperability between different systems. Nevertheless, with continued advancements in technology and increasing demand for efficiency and convenience, it is likely that automated cheque processing will continue to grow in importance and become a standard feature of banking systems worldwide.

III. ACKNOWLEDGEMENT

A sincere thanks to our final year project guide Dr. Zahir Aalam for helping us in writing this paper. He graciously explained to us the concepts related to image processing & the little nuances of the automated system.

With the help of many resources compiled together, we have prepared a research paper that defined our potential of understanding automated cheque processing system.

Real Time Tracking of Students Learning Outcome and their Academic Progress across Schools

Mrs. Veena Kulkarni, Mr. Hardik Singh, Mr. Satyam Singh, Mr. Siddharth Singh, Mr. Hrishikesh Tiwari, Computer Department
TCET
Mumbai, India
veena.kulkarni@thakureducation.org, hardikgamer2098@gmail.com, satyamsingh2003a@gmail.com, siddharthmsingh2001@gmail.com, tiwarihrishi1903@gmail.com

Abstract: **In the modern age of education, the focus is shifting towards the outcomes and the quality of education that the students receive. To meet this demand, we can develop a software system that tracks the real-time progress of students' learning outcomes. This system enables teachers to monitor and assess the students' performance in a more efficient and effective manner.The software system utilizes various data sources, such as assessments, quizzes, and assignments, to capture the students' learning outcomes. It provides real-time feedback to the teachers and the students about the progress being made towards achieving the learning objectives. This system also allows for data analysis and reporting, which can help teachers identify gaps in the learning outcomes and design more effective teaching strategies.The software system will be designed to be user-friendly and customizable, enabling teachers to adjust it according to their specific teaching methods and learning outcomes. The system is also secure, with different levels of access available to ensure the confidentiality of student data.The software system will be a valuable asset for educational institutions that want to provide a quality education to their students. The ability to track the progress of students' learning outcomes in real-time will enable teachers to be more proactive in their teaching, leading to better learning outcomes for students.**

I. INTRODUCTION:

In recent years, education has undergone significant changes with the introduction of new technologies. These technological advancements have made it easier for teachers to deliver instruction and for students to learn. However, there is still a significant gap in the way that learning outcomes are monitored and assessed. Traditional methods of assessment are often limited, and do not provide real-time feedback to teachers and students.

To address this challenge, we have developed a software system that tracks the real-time progress of students' learning outcomes. The system provides teachers with a comprehensive tool to monitor and assess their students' progress towards achieving learning objectives. This software system is designed to work with various data sources, such as assessments,

quizzes, and assignments, to capture student performance in real-time.

The purpose of this paper is to describe the development and implementation of the software system, as well as its technical features and capabilities. The paper will provide an overview of the system architecture, the data sources used, and the algorithms that enable the real-time tracking of learning outcomes. It will also highlight the system's user interface, reporting capabilities, and security measures.

The software system is a valuable asset to educational institutions that seek to improve the quality of education that they offer. The system enables teachers to be more proactive in their teaching, identify gaps in learning outcomes, and design more effective teaching strategies. Furthermore, the system provides students with real-time feedback on their performance, allowing them to track their progress and take ownership of their learning.

In the following sections of this paper, we will provide a detailed description of the software system, its technical features, and its benefits to educational institutions.

II. LITERATURE SURVEY:

In this section we will provide some literature survey of some pre-existing softwares that is used for real time tracking of students' learning outcomes.

One such pre-existing software is Blackboard Learn. Blackboard Learn is a Learning Management System (LMS) that provides educators with the tools to deliver instructional content, engage students in discussions, and assess student performance. The system features a Grade Center, which allows teachers to create assignments, quizzes, and exams, and track students' progress in real-time.

Another example is Brightspace. Brightspace is an LMS that offers features such as online assessment, communication tools, and data analytics. The system enables teachers to track students' progress towards learning outcomes and identify areas where additional support is needed.

Canvas is another popular LMS that provides real-time tracking of students' learning outcomes. The system features a gradebook, which allows teachers to record and track student performance, and provides detailed reports on student progress. Canvas also offers communication tools to enable teachers to engage with their students and facilitate learning.

Moodle is an open-source LMS that also provides real- time tracking of students' learning outcomes. The system features a gradebook, which allows teachers to assess student performance, and provides feedback to students on their progress. Moodle also offers a range of assessment tools, such as quizzes and assignments, to measure student understanding of course material.

In conclusion, there are a variety of pre-existing software solutions that enable real-time tracking of students' learning outcomes. These Learning Management Systems offer a range of features and capabilities, including gradebooks, assessment tools, communication tools, and data analytics. The use of such systems enables teachers to monitor and assess student progress in real-time, and identify areas where additional support is needed to improve learning outcomes.

Advantages of such software: There are several advantages to using a software system that tracks the real-time progress of students' learning outcomes:

1. Improved student engagement: When students can see their progress in real-time, they are more likely to stay motivated and engaged in their learning. The software system provides them with immediate feedback.

2. Enhanced teacher efficiency: The software system allows teachers to track student progress more efficiently and effectively, reducing the amount of time they need to spend on manual grading and record-keeping. This, in turn, enables teachers to spend more time on teaching and instructional planning.

3. Personalized learning: Real-time tracking of student progress allows teachers to identify individual student needs and provide targeted interventions to support learning.

4. Data-driven decision making: The software system collects and analyzes data on student performance, allowing for data-driven decision-making in instructional planning. This can help teachers identify areas where more support is needed, and adjust their teaching strategies accordingly.

III. METHODOLOGY

A) Student Module

The authentication module allows the user to login or register so that they can make use of the features provided by the quiz application. The user can access their semester's attendance and their marks after they Sign In into their account. The users are asked to register with username, email, phone number and their designation. The email of the user should be the college email-Id. These data are verified by firebase authentication. After verification firebase provides a unique user-ID called u-id. U-id along with other user data is stored in the Cloud Firestore. The stored data can be fetched and sent to dashboard during login process. The data can be viewed in the data visualization.

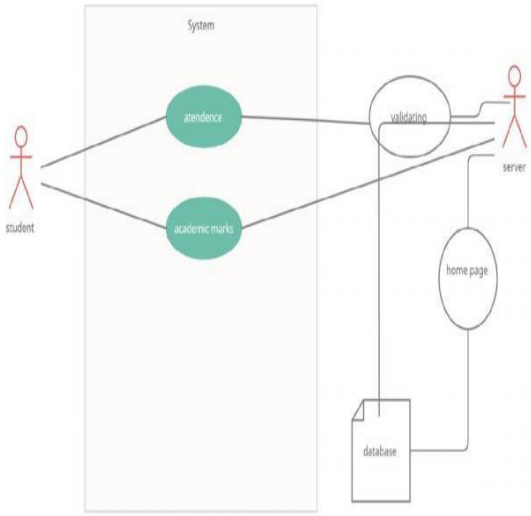

Fig 3.2 Usecase diagram for student module

B) Coordinate Module

The coordinators are asked to register with username, email, phone number and their designation. These data are verified by firebase authentication.

After verification firebase provides a unique user-ID called u-id. U-id along with other user data is stored in the Cloud Firestore. The stored data can be fetched and sent to dashboard during login process. There are three roles for the user which are user, coordinator and admin. The coordinator can update the data and modify the data to student, but they can't change the attendance of the Student.

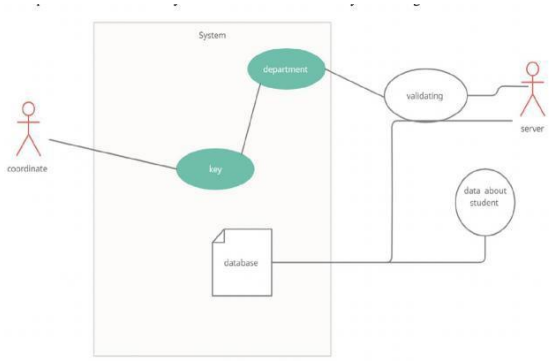

Fig 3.3 Usecase diagram for coordinate module

C. *Admin Module*

The admin can add the data and delete the user according to the requirement, admin is responsible for data of student. The authentication module allows the user to login or register so that they can make use of the features provided by the quiz application. The users are asked to register with username, email, phone number and their designation. These data are verified by firebase authentication. After verification firebase provides a unique user-ID called u-id. U-id along with other user data is stored in the Cloud Firestore. The stored data can be fetched and sent to dashboard during login process.

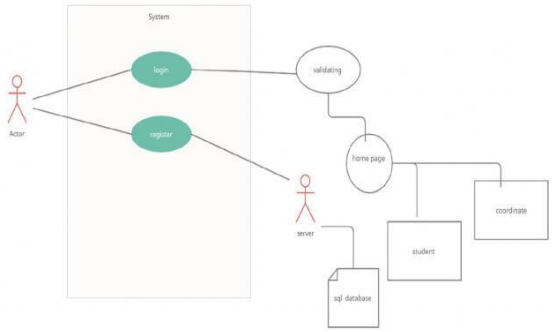

Fig 3.4 Usecase diagram for admin module

The stack that can be used is MERN stack since it can will not be much of data and a limited amount of users.So Nodejs at the backend and reactJs at the frontend will be more faster and secure.However, one can also use Firebase at the backend to make the process easier and faster.But however Nodejs & MongoDb will be the best suited option to go with since there will be more customization to the features and faster and comparatively more users can access the websites.

IV. RESULT AND DISCUSSION

The authentication module of a quiz application allows users to login or register using their college email and other personal information verified by Firebase. Upon verification, users receive a unique user ID (u-id) which is stored in the Cloud Fire store along with their other data. There are three roles: user, coordinator, and admin, with the admin responsible for managing student data. Users can access their attendance and marks upon logging in, and the admin can add or delete users as needed. The stored data can be viewed in a dashboard and used for data visualization

By verifying user information and storing it securely, the application can ensure that only authorized users can access sensitive data, while providing administrators with the necessary tools to manage user accounts and data. In addition to its security and management functions, the authentication module also provides a seamless user experience by allowing users to easily access their data and the application's features. By streamlining the login and registration processes, users can quickly get started with the quiz application and focus on their academic performance, while coordinators and administrators can efficiently manage student data.

V. CONCLUSION

In conclusion, the authentication module is a crucial aspect of a quiz application that enables secure login and registration for users, while allowing them to access their attendance and marks. By storing user data in the Cloud Fire store and verifying it through Firebase authentication, the module ensures that only authorized users can access sensitive data.

Additionally, the module supports multiple roles for users, coordinators, and administrators, providing efficient data management and allowing administrators to manage user accounts and data. Overall, the authentication module is a vital component of a modern quiz application that prioritizes security and user experience Overall, implementing a software system that tracks the real-time progress of students' learning outcomes can bring about significant benefits for both teachers and students. It not only enhances the efficiency of teachers, but also helps students stay motivated and engaged in their learning. With the ability to personalize learning and make data-driven decisions, this system can support academic success and promote continuous improvement in the education process. As such, it is a valuable tool for improving student learning outcomes and helping them reach their full potential

VI. ACKNOWLEDGEMENT

Access Control For Digital Content Using Steganograph

Dr. Rekha Sharma, Mr. Yash Sinha, Mr. Chandrabhan Singh, Mr. Ronak Singh, Mr. Aman Shrivastav, Computer Department
TCET
Mumbai, India

Abstract: **Access Control for Digital Content Using Steganography is a method for securing digital content by embedding access control information within the content using steganography techniques. This approach allows content owners to control who can access and use their digital content, without relying on external systems or technologies. The abstract of this paper describes the proposed method and highlights its potential benefits for content security and access control. It is a novel approach that employs steganography to embed access control information into digital content to protect it from unauthorized access. This technique is aimed at addressing the security challenges that arise when using traditional access control methods that depend on external technologies or systems. This provides a brief overview of the proposed method, emphasizing its ability to provide content owners with a more secure and efficient way to control access to their digital content. The potential benefits of this approach for content security and access control are also highlighted. This approach offers several benefits over traditional access control methods, including increased security, reduced reliance on external systems or technologies, and improved flexibility. The main point is that the creators don't need to send their works to the content users. They only send keys to extract the digital works out of the image data that the users have downloaded from the creator's home page**

.

*Keywords**: Steganography, LSB, BMP, Stego, Content-embedding, BPCS, Secure Access Control Mechanism***

I. INTRODUCTION:

Digital contents are created by photographers, graphic designers, illustrators, animation cartoonists, musicians, movie producers, and more. Moreover, we can say that novelists, poets, news reporters, engineers, researchers and professors are all digital content creators because they create some type of digital content by using computers. The created contents are in some cases printed out on a paper surface to make a newspaper or a book, in other cases they are put into CD disks to make music albums. Also, they are often broadcast on TV either in a free or charged manner. These are traditional styles of content distribution.

In the Internet age today and tomorrow, everyone can be a content creator because everyone can produce some types of digital content by computers. But still there are professional content-creators. Most of the professional- created contents will be distributed in a traditional manner. Some other professional-created and many non- professional-created contents may be directly transferred from the creator to the content-user (e.g., from a novel author to a reader) over the Internet. In this case, the creator must first publicize the information about the content. A creator will do this by uploading such information onto his "home page." However, he cannot upload the content data there, because if once uploaded, everyone can download it free. But, it is not the situation the content creator wants to be in. He wants to have some new Internet distribution method that implements a safe uploading and downloading. The most important point is, the creator wants to exclusively control the content distribution by himself. There is no such system available as of today.

The difference between the traditional and a new content distribution control, i.e., content access control, is the following. In a traditional method, controls are set equal for everyone. For example, if someone wants to buy a digital poster from a shop, the price is the same for

everyone. The copyright terms are the same. The license expiration term, if ever, will be the same. All the controls are beyond the reach of the content creator, and he cannot respond to the users' requests one by one in a flexible manner. The new method that we are proposing is very different. A creator needs two types of data. One is the content data itself; the other is the information data that informs the public what types of contents are where. We call the latter data "introduction-data" of the content. The introduction-data should be placed on the Internet, but the content data should not be there in a visible manner. The two type of data are different in the role, but they must be associated with each other. The important point is that the content creator is the only person who can control access to the digital contents he created. Of course he must have his own home page from where he can distribute his contents to the public.

Access control is a crucial aspect of digital content security, allowing content owners to restrict access to their content to authorized users only. Traditional access control methods, such as digital rights management (DRM), rely on external systems or technologies to enforce access restrictions, which can be costly and complex to implement. This paper proposes a new approach to access control for digital content using steganography, a technique that involves hiding information within the content itself. The proposed method uses steganography to embed access control information within the digital content, making it difficult for unauthorized users to detect and circumvent the access controls. The method also uses encryption to protect the embedded access control information, ensuring that it cannot be easily compromised. This approach has several potential benefits over traditional access control methods, including increased security, reduced complexity, and improved flexibility. The paper presents the proposed method in detail, including its implementation and evaluation, demonstrating its effectiveness in protecting digital content from unauthorized access.

1.1 Digital contents embedded in the Home Page images

Steganography is often quoted as "art and science of ……." in several contexts. This implies that steganography is not an ordinary information technology, but is a sophisticated and scientifically sound technology. In the category of information technology, it is a part of "information hiding" belonging to data security category in the information security technology. Fig. 1 illustrates the hierarchy.

Fig. 1 Steganography and related IT technologies

Steganography refers to the process of hiding some secret information in some inconspicuous vessel data by embedding. An example of secret information is a "diplomatic correspondence record of a government." A typical vessel data is a color image taken by a digital camera. "Embedding" in this context is to swap a part of the vessel data with the secret information data.

The merits of this content distribution scheme are as follows.

A. Content creators need not send their digital works to users.
B. Creators can control the whole process of the distribution. In other words, creators can make an exclusive access control of his digital works.
C. Creators are freed from negotiating with publishers, record companies, and all the middlemen in the distribution process.
D. A content-user can order any special combination of the works, in other words, the creator can be flexible to the user's request.
E. No delivering costs are coming to both creators and users.

As the new distribution method is based on a steganographic information embedding scheme, we will briefly review "steganography" in the following section

I. METHODOLOGY:

The methodology for access control of digital content using steganography typically involves the following steps:

1. Identify the sensitive information to be protected and the non-sensitive data to be used for hiding it.
2. Choose a steganography algorithm that is appropriate for the type of digital content being protected, such as text, image, audio or video.
3. Apply the steganography algorithm to embed the sensitive information into the non-sensitive data. The embedding process should be done in a way that minimizes the impact on the quality and functionality of the non-sensitive data.
4. Distribute the steganographically protected digital

content to authorized users or systems.

1. Implement other access control measures, such as encryption and authentication, to ensure that only authorized users or systems can access the sensitive information.

LSB:

Palette based images, such as GIF images, are popular image file format commonly used on the Internet. GIF images are indexed images where the colours used in the image are stored in a palette or a colour lookup table. GIF images can also be used for LSB steganography [5], although extra care should be taken. The main issue with the palette-based approach is that if one changes the least significant bit of a pixel, it could result in an entirely different colour since the index to the colour palette gets modified. One possible solution to this problem is to sort the palette so that the colour differences between consecutive colours are minimized. The strong and weak points regarding embedding information in GIF images using LSB is that since GIF images only had a bit depth of 8, the total amount of information that could be embedded will be less. GIF images are vulnerable to statistical as well as visual attacks, since the palette processing which has to be done on the GIF image leaves a clear signature on the image. This approach was dependent on the file format as well as the image itself, since a wrong choice of image could results in the message being visible.

Embedding and extracting program

A content creator needs an embedding program and a content user needs an extracting program. Two programs cannot be independent from each other. Rather, they must coordinate each other. These programs will be provided by a software developer. The embedding program will be priced, while the extracting program may be free. The high-speed embedding and extracting operation is the key requirement. Some other requirements are the following.

Information embedding component

Content-embedding is executed by the Information Embedding component. The acceptable file types for the vessel image are BMP, PNG, and JPG. They must be in a RGB color format. The image size must be equal to or larger than 128 X 128 and less than or equal to 3,200 X 3,200 pixels. For BMP and PNG images the BPCS- embedding method is used, and for JPG images the F5 algorithm is used. The embedding data must be a folder-structure having several files and folders. One special case is having an “index.html” file right under the topmost folder. In this case the extracting program operates in a special manner. “Global Access Key” is the key to access (i.e., extract) the topmost folder. The “complexity threshold value” is a very important parameter in BPCS. It balances the embedding capacity and the image quality .

The output image format, i.e., the stego image format, is selected from among BMP, PNG, and JPG files. The BMP and PNG embedding schemes are exactly the same. The only difference is that a BMP stego file is not compressed after embedding, while a PNG stego file is the compressed version of the BMP output in a lossless manner. Therefore, the BMP and PNG embedding capacities are the same, and are calculable before embedding if the complexity-threshold value is provided. The threshold value can be set at any value ranging from 0 to 55. However, the default complexity threshold was set to 40. In the JPG case the embedding capacity is not calculable before embedding. In most JPG embedding the capacity falls to around 10% of the vessel image.

Information extracting component

The information extracting component extracts the embedded data, i.e., files and folders, out of the given stego image in BMP, PNG, and JPG file formats.

The Global Access Key must be given in the same way as it was given for embedding. A Folder Access Key File (see Sec. 5.3) is a set of Folder Access Keys provided by the content creator. It makes “selective folder extraction” possible. It must be input to the system to start the extracting operation. The complexity threshold value must be given in exactly same way as it was given for embedding. The extraction mode is either “As it is” or “Link to Web.” As-it-is mode extracts the embedded data just as it was when embedded. Link-to-Web mode operates differently. In this mode, if the program finds an “index.html” file right under the top-folder, then after extracting, the program will start running that index.html file instantly. This operation can lead the system user (someone who runs the extracting program) to the WWW world directly without starting a Web browser manually. This operation can seamlessly link the content users to a special content location that is owned by the content creator, or by someone who embedded the content.

II. LITERATURE REVIEW:

Several research studies have been conducted on the use of steganography for access control of digital content. Here are a few examples:

1.1. "Digital Image Steganography for Access Control of Sensitive Information" by P. Dhiman and A. K. Sharma (International Journal of Computer Applications, 2014) - This study proposed a steganography-based access control method for digital images that hides the sensitive information in the least significant bit plane of the image. The method was found to be effective in concealing sensitive information while maintaining the visual quality of the image.

1.2. "A Secure Access Control Mechanism for Multimedia Content Based on Steganography" by S. Choudhary and V. Bhatnagar (International Journal of Computer Science and Network Security, 2018) - This study proposed a steganography-based access control mechanism

for multimedia content that uses the LSB substitution method. The method was found to be effective in protecting sensitive information in multimedia content while preserving its quality.

1.3. "A Novel Access Control Scheme for Digital Images using Visual Cryptography and Steganography" by S. Agrawal and S. S. Sakhare (International Journal of Computer Applications, 2016) - This study proposed a hybrid access control scheme that combines visual cryptography and steganography to protect digital images. The method was found to be effective in providing secure access control of images while maintaining their visual quality.

These studies and others suggest that steganography can be an effective method for access control of digital content, particularly for multimedia content. However, the choice of steganography method and its implementation should be carefully considered to ensure that it provides the required level of security and does not compromise the quality or functionality of the content.

III. CONCLUSION:

Digital content creators will get more secure for their data, without the permission of the owner no data can be easily passed. Access control privacy and secret message can be passed to other user without exposing that data to third person and privacy can be maintained. Steganography is an intriguing and successful method of data hiding that has been utilized for centuries. Such cunning strategies can be exposed using certain techniques, but acknowledging their existence is the first step. This type of data hiding is also used for many legitimate reasons, such as secured storage techniques. In either case, the technology is both straight forward to use and scarce. The further you may proceed in the game, the more you will understand about its features and functionalities.

Steganography can be an effective method for access control of digital content by hiding sensitive information within non-sensitive data. It can be used to prevent unauthorized access to digital content by making it difficult to detect the presence of sensitive information.

Furthermore, the use of steganography for access control raises ethical concerns, as it may be used to conceal illegal activities or infringe on privacy rights. Therefore, its use should be carefully considered and implemented in compliance with applicable laws and ethical standards.

IV. FUTURE SCOPE

Access control for digital content using steganography has significant future scope, as it is a highly effective and secure way to protect the distribution of digital content. Here are some potential future developments in this field:

Steganography with artificial intelligence (AI): AI can be used to improve the performance of steganography techniques, making it more difficult for unauthorized users to detect the hidden information. AI can also be used to create more sophisticated steganography algorithms that can embed larger amounts of data within cover media.

Quantum steganography: With the advent of quantum computing, quantum steganography techniques can be developed that use the principles of quantum mechanics to hide data within cover media. This would provide an even higher level of security for digital content distribution.

Steganography for real-time communication: Steganography techniques can be developed that can embed data within real-time communication channels, such as video conferencing or voice-over IP. This would provide a new level of security for real-time communication, which is currently vulnerable to interception and eavesdropping.

Blockchain-based steganography: Steganography can be used in combination with blockchain technology to create a highly secure and tamper-proof way to distribute digital content. The use of blockchain technology can also provide a secure and transparent record of the distribution of digital content.

Overall, the future of access control for digital content using steganography is promising, with many potential developments that could enhance the security and effectiveness of this technology.

Intelligent AI Based Women Safety Device

Jatin Sanjay Vishwakarma , Saurabh Vishwakarma ,
Computer engineering deaprtment,
TCET, Mumbai, India.
jatinvishwakarma75@gmail.com , saurabhvishwakarma745@gmail.com

Abstract — **In the current scenario women safety as being a major problem for both urban and rural areas. There are very few impeccable systems that ensure the safety of women. In this project, we have given a better methodology for the safety of women by using IOT & AI&ML. Major components used are ARDUINO - NANO, GSM, GPS, AI CAMERA, AI-VIRTUAL ASSISTANT. In an emergency, a person can just say the code word (chosen by him/her) or just press a button on the model or by pressing an emergency button in App by this, the system will get active and nearest police station & family members would be updated about the current status of person. This system works manually as well as by voice command. The integration of all these elements collectively offers this device to be more secure and easy to navigate.**

Keywords— *IoT device, AI-Virtual Assistant, Arduino-NANO, GSM, GPS, Voice controller, Women safety device.*

I. INTRODUCTION

Cases of molestations & criminal attack have increased these days. We surely are developing but on the other hand some people are just stagnant at their level of imagination. For them some people around are just a mere source of satisfaction or entertainment which increases the insecurities and marks the doubt on the system of safety. According to NCRB (national crime record bureau), In the year 2019, 32033 cases were registered which means 88 cases and daily and every one case in 12-15 min, slightly lower than the year 2018, where 91 cases daily were registered. These numbers are exorbitant and hence the biggest unanswered question is "Are women and kids safe nowadays?" being a part of society it's our responsibility to think about it.

In the year 2010, the NIRBHAYA CASE, where a woman along with her friend was traveling in a private bus. There were six others on the bus including the driver, culprits who molestated her. Eleven days after the assault she was transferred to a hospital in Singapore for emergency treatment but died two days later.

26-year-old veterinary doctor, in the year 2019 was the victim of molestation, and after the incident, the culprits killed her by burning her alive. After the investigation, four suspects were arrested but this investigation took much more time to get her justice.

The following chart represents the current scenarios in the Crime on Women. According to data, in 30.9% of the cases, the culprits are known members and they harass women for dowry or any misleading lifestyle, etc. In 21.8% of the cases, such incidents happen just to harm the reputation or modesty of the women. In 17.9% of the cases, women are kidnapped or abducted for money on any rivalries, etc.

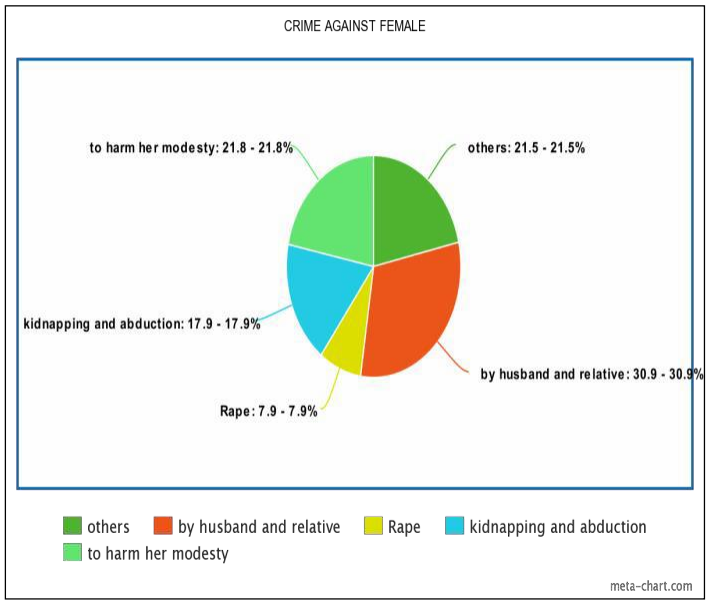

Fig 1: "Misconduct Event by society"

In this modern era people are learning and are respecting all the genders equally, still in some parts they are unable to fight for their rights. Still people of a denting mentality exist. We designed something which can fill the gap and complete the dream of a safe society. In the past few years, several unwanted incidents were reported and unfortunately this numbers are increasing, so the device to protect themselves should be portable and easy to use (communication & functioning) So to safeguard people we need to use the technology, IoT has made easy to communicate over the internet, the devices and system connected to this can transfer and receive information and improves the performance. The device is specially designed for the people who get distressed in such a situation. This system will get family members & police to track, locate, communicate, and record the incident and to help them, to guide them to a safehouse (nearby hospital, police station, mall, etc.

II. EXISTING TECHNOLOGY

In past years many researchers have worked on women safety like:

- Author of the paper [1] has designed an App for sending SMS and calling functions when the user presses the emergency button.

In the paper [2] the author has designed a **foot device** that is portable and can be used as a self-defense system for women which will be for the foot by using **ARDUINO ATMEGA-328**. With a knife attached to it for the girl's self-defense.

- In paper [3] the Author has made a "**SALVUS**" device that works on **GSM & microcontrollers** which also share location and SMS in danger for women's security.
- In paper [4] the author has proposed an idea of a **handbag** that women can carry with them easily, the handbag has an integrated camera for image capturing and Pepper spray and electric shock for women's self-defense.
- In the paper [5] Author is providing security by embedding touch sensors and pulse sensors in an **Arduino-based module**. Through GSM and GPS further messages are sent to the registered contact such as Police stations, family, or friends.
- In paper [6] Author has proposed a model which will command the fingerprint of the user and alert the system and good wishes by SMS and call.
- In paper [7] the author has proposed an App for women's safety which will function by **voice control** and input in the app or by shaking the device continuously for a long time by the user and the App will function by sending SMS to the family members for the rescue of the girl.
- In the paper [8] Author has proposed the idea by using Arduino, GSM, GPS module will **detect the movement of the user** and let the parent or guardian know where and when the user is going were, it will be good practice for women safety as good wisher of women will be able to locate and track her.
- In paper [9], the author has studied the novel algorithms to detect face and eyes by using a **stereo camera**, which can be used to detect and for analysis of the culprit's Face and gesture detection for tracking him with many ways for fast approach.
- In paper [10] the author has given an idea **for women safety awareness** in youths through various social media platforms like Instagram, Facebook and Twitter.

III. PROPOSED METHODOLOGY

When the user will press the button present on the device continuously for 5 seconds or just say the code word (chosen by user) or press the emergency button provided in-app, then the system will get triggered and all the components will be activated and ready to function at their highest potential, at that moment by the help of GSM and GPS module the location will be shared to the nearby police stations and family members of the user.

The camera will stream the video through the help of app with the police and family members, they can also communicate via Bluetooth and by this police and family members can view and listen to victim and try to help her out.

The AI-VIRTUAL ASSISTANT TECHNOLOGY is embedded in this system and this will help the victim to drive her to the nearest safe house like Hospital, Mall, Police station, etc. As Women can ask the system for safe houses near by her and the AI system will find the nearest safe house and guide her to there by using IoT and speakers present in system as a voice assistant and by following all the instruction given by the AI system, victim can reach to Safe house to rescue herself. In such circumstances, if the victim reached safe house and then too, she is unsafe then she can ask the AI virtual Assistance to guide her to next safe house. GPS will transfer all the location details throughout the RED MODE. There is an NLP TECHNOLOGY (National language understanding) in this AI system by which the system can understanding everything user says in various languages and AI system can also analyze, alter, understand and generate natural language.

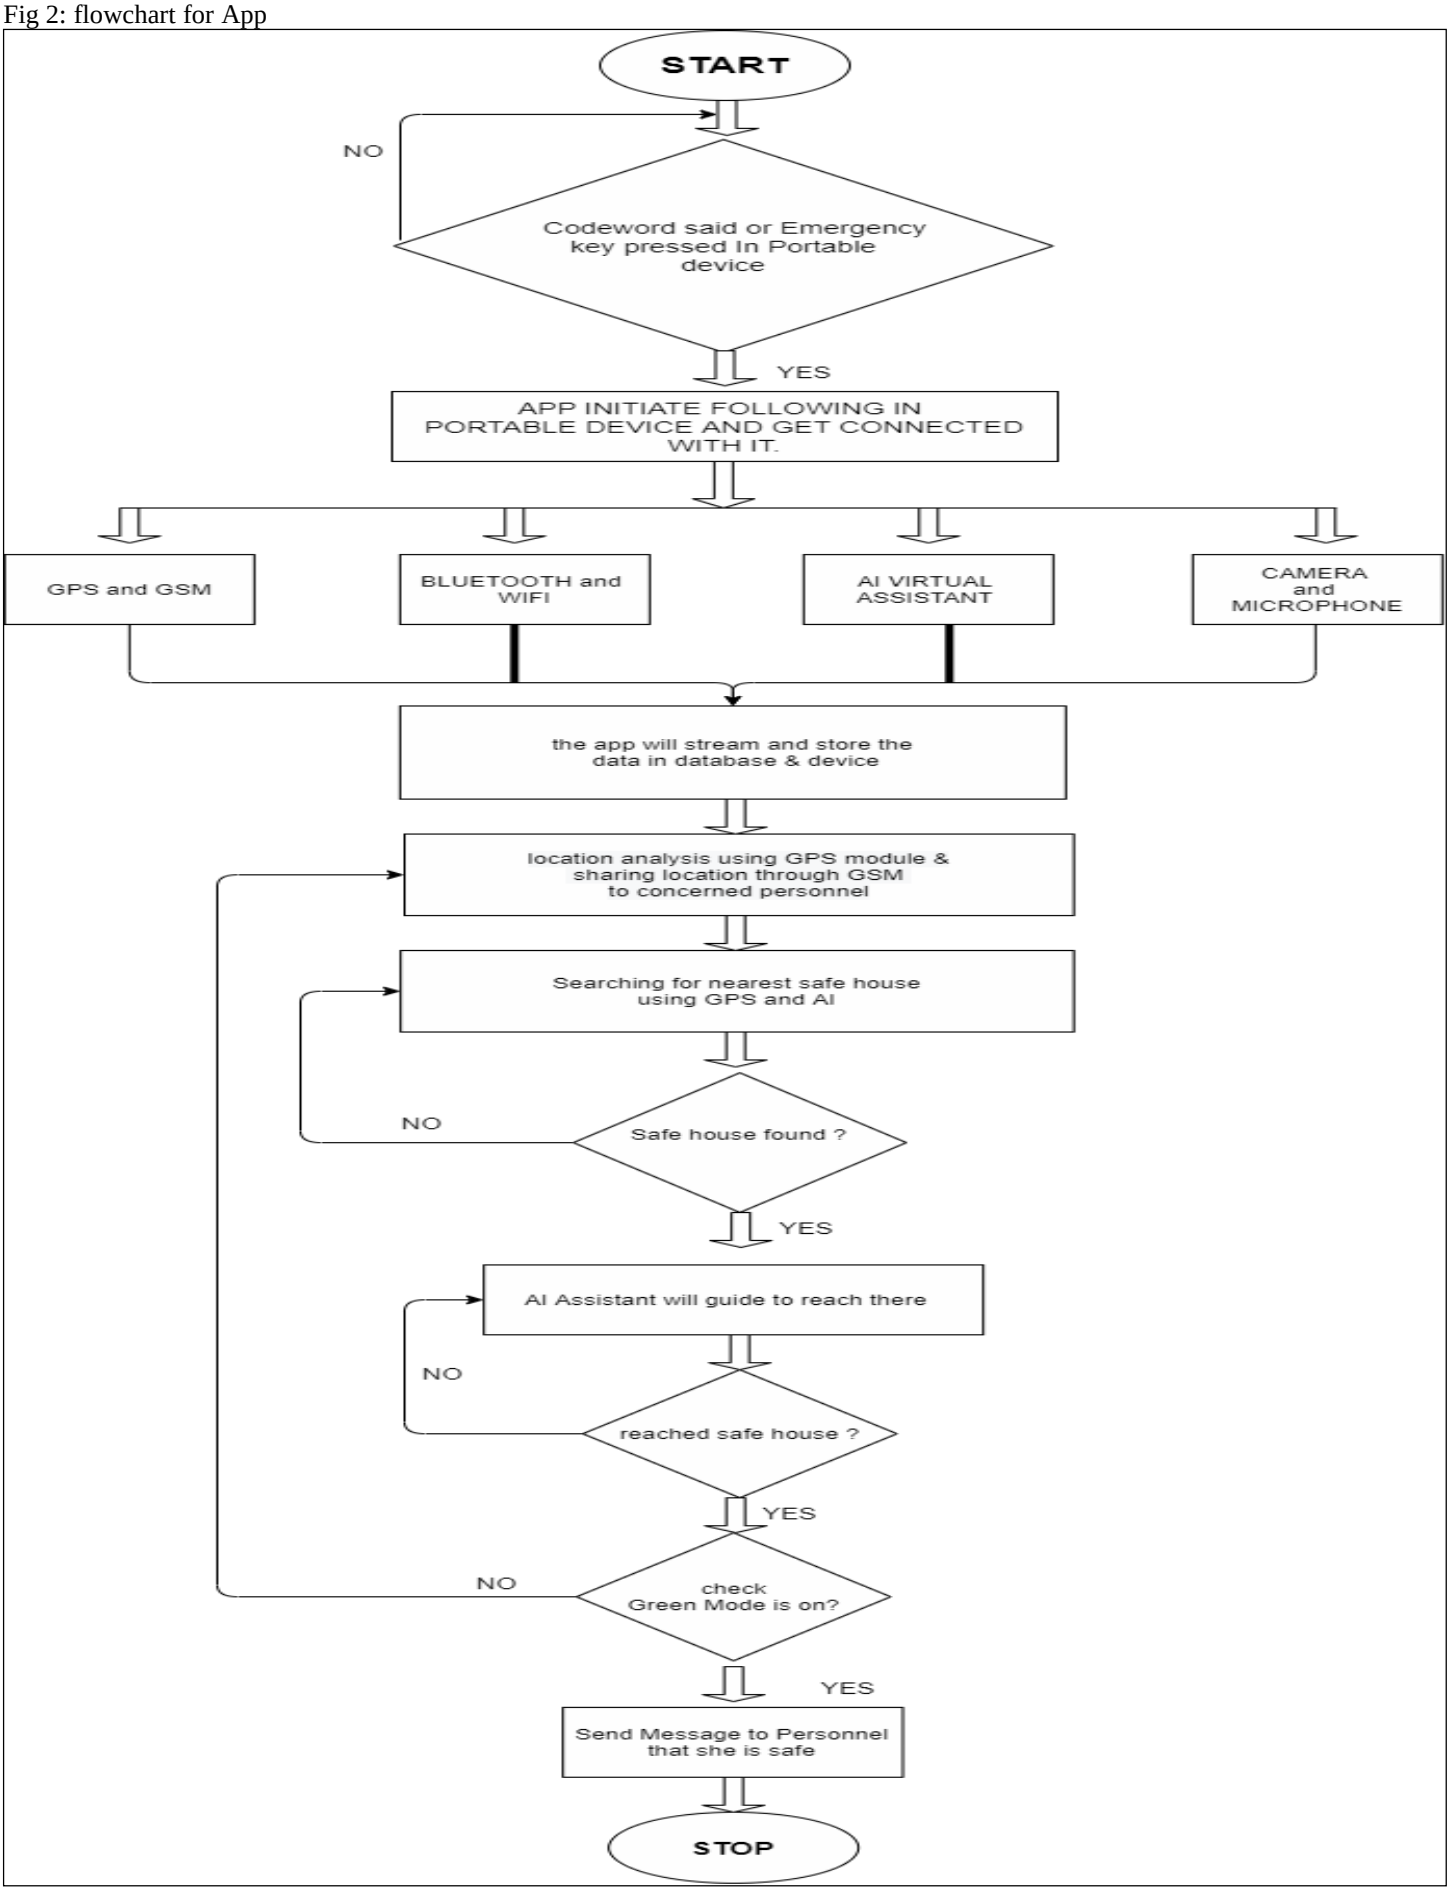
As a single woman can't face 4-10 people at a time so for her help if another user (who is using this system) or a volunteer who is nearest to crime point, the system will give him/her notification that "someone needs your help "and the volunteer and that user can reach the location as soon as possible and girl can get support for her safety until police have not arrived help to victim as earlier as possible and there will be Google-Map API integrated in the app to get the directions to reach victim for the updated Volunteer or User about the situation.

When the system is in RED MODE (triggered by user) all the data, images, sounds, and location will be saved in the database of police as well as of the user as the investigation team can get every piece of evidence and can link to get the culprit. The AI camera present in the system will give a proper analysis of the culprit's different appearance like (physical changes- haircut, beard, external accessories, etc.). By using AI and deep learning, we can integrate the IntelliVision's face recognition which has the public test database accuracy of 99.6% and mega face (with 1000 people/distracters) is 95.6%. Face Recognizer is available with a REST API/SDK for application which will result in easy integration through http/JSON and with open architecture which can run on any system like Windows, Mac, Linux, etc.

In the case of any violence with the system like an attempt to steal or break, the fingerprint sensor presents on the outer body of the system will capture the biometric detail of the culprit and can be recorded in the database, by which police can get the whole information by (Aadhar, pan, election card) database of the culprit and police can easily track him/ her. As it can be also beneficial to get the more and more data about the culprit by capturing the biometric details. If the Attackers as where'd the gloves in such situation, the sensor can be updated with the textile pattern reader as different textile material as its own properties and texture style and thickness by this we can the type of material gloves the attacker is using, and it can be beneficial to an Investigation team.

Green mode is used to disabled the red mode, the green mode is enabled only when the woman who needs help has been rescued, and enabling the green mode send

Fig 2: flowchart for App



IV. EXPECTED OUTCOME

This system will provide us the full proof evidence for investigation to catch the culprit and to analyze the incident "what has happened their". System will provide safety and self-assurance for individuals. As for working of system a good number of volunteers are required so there should be public awareness about product and it will also help to raise the product sales.

System will not only provide the protection but also decrease the investigation time by providing the video and audio which was captured by the device and in this way, they can get justice along with protection and security.

By use of this there will be awareness between people about the women security and by this we can see some changes in the number of crimes. Every school/college going girl should use this as this will help them a lot being secure.

V. CONCLUSION

Nowadays investigation takes more time and justice is postponed, due to which culprits get a full chance to eradicate all the evidence and run away. But this system will not only provide the protection but also decrease the investigation time by providing the video and audio which was captured by the device and in this way, they can get justice along with protection and security.

Without women's progress, a country cannot move forward, yet we see many women suffer a lot of harassment on their way of success/progress, which is a big obstacle in their progress. For this reason, decided to work on a project which will help millions of women. The main benefit of using this safety system is that women can feel confident when they go outside as they can quickly get support through the system when they are in danger. The device we invented for Women's Safety is made up of two separate tools. One is hardware or portable system and the other is the software i.e., App. The two tools can provide women's safety independently.

But it is expected that maximum safety will be ensured when using the entire system simultaneously. In addition, a lot of public awareness is needed to motivate people to become a volunteer and help various life by supporting them in danger. The AI camera will capture all the incident images and the microphone will get audio and the GPS & GSM module for location tracking and further investigation. The heart rate monitor will help us to record the women's physical health and blood pressure through any medical support that can be provided as soon as possible.

VI. FUTURE SCOPE

As this project has various technical and advanced machining parts which will take the cost to almost the price of a smartphone and to provide this in a rural area will be the biggest challenge because of this price but in future, we expect to get in a price which is affordable for any society, family, area. In future, we expect to create a design which will be around 5 cm which will weight few grams and it will be comfortable for the user to carry it anywhere easily. As in the world, there are a lot of families and women who can't afford to buy this and most cases are registered by such places, all should help, donate, and spread awareness for using this device. We hope that the proposed device will definitely bring drop in the case numbers and every woman and girl would live her life with security and a sense of satisfaction.

Design Of Educational Games

Mr.Priyam Shrivastava , Mr.Rahil Siddique , Mr.Aditya Soni , Mr.Samad Siddique , Mr.Vikas Singh ,
TCET Mumbai, India

Abstract-**The use of video games as an educational tool has gained traction in recent years, providing an engaging and interactive learning experience. The design of an educational video game requires careful consideration of the learning objectives, target audience, game mechanics, and game content. This paper explores the process of designing an education video game, highlighting the importance of defining clear learning objectives, identifying the appropriate target audience, and creating game mechanics and content that reinforce the learning objectives. The paper also emphasizes the significance of testing and refining the game to ensure that it effectively achieves the intended educational outcomes. This framework can serve as a valuable resource for developers in creating effective educational video games.**

I. INTRODUCTION

As technology continues to shape our daily lives, video games are increasingly recognized as a powerful tool for learning. Educational video games offer an interactive and engaging way for learners of all ages to develop new knowledge and skills. These games have the potential to be effective learning tools, but their design requires careful consideration of the learning objectives, target audience, game mechanics, and game content. The design process of an educational video game involves more than just creating an engaging game with a few educational elements. It requires a deep understanding of the learning objectives and how they can be integrated into the game mechanics and content to create a game that einforces and enhances the learning experience. The game's design should be tailored to the target audience's needs, learning styles, and interests to ensure that it is engaging and enjoyable to play. Additionally, developers must test and refine the game to ensure that it is effective in achieving the desired educational outcomes. This paper will explore the design process of an educational video game in detail, providing insights into the essential steps involved in creating an effective learning tool. The framework outlined in this paper will provide a valuable resource for developers looking to design educational video games. By following the guidelines set out in this paper, developers can create educational video games that are both engaging and effective in achieving the intended learning outcomes.

II. METHODOLOGY:

The methodology for designing an educational video game involves a structured and iterative process that includes the following essential steps:

Defining learning objectives: The first step in designing an educational video game is to clearly define the learning objectives. The learning objectives should be specific, measurable, and aligned with the curriculum or subject matter being taught. Identifying the target audience: Once the learning objectives are established, the next step is to identify the target audience. The target audience could be students of a particular age group, level of education, or with specific learning needs.

Designing game mechanics: Game mechanics are the rules and systems that govern the gameplay experience. The game mechanics should be designed to reinforce the learning objectives and engage the target audience.

Creating game content: The game content should be designed to support the learning objectives and be engaging and enjoyable for the target audience. The content should be visually appealing, relevant, and presented in an organized and structured manner.

Testing and refinement: The final step in the design process is to test the game with the target audience and refine it based on their feedback. The game should be tested for usability, effectiveness in achieving learning objectives, engagement, and overall game experience.

The design methodology should be iterative, with each step building upon the previous one. The process should be repeated until the game is deemed effective in achieving the learning objectives and engaging the target audience. This methodology provides a structured and comprehensive approach to designing an educational video game that can lead to effective and engaging learning experiences for students.

III. LITERATURE REVIEW:

Video games have been gaining popularity as a tool for learning, particularly in the education sector. Educational video games are designed to teach specific concepts or skills, and their interactive and engaging nature can increase student motivation and knowledge retention. This literature review will explore the existing research on the design of education video games and provide insights into the most effective design principles.

One of the key principles of designing educational video games is the alignment of game mechanics with learning objectives. According to Gee (2003), a game's mechanics must support the learning objectives and ensure that the game is both engaging and effective. This principle is supported by the work of Kebritchi et al. (2010), who found that the incorporation of instructional design principles, such as clear learning objectives, feedback, and scaffolding, significantly improved learning outcomes in educational video games.

Another design principle is the consideration of the target audience's needs, interests, and learning styles. In a study by Liu and Chuang (2010), it was found that the design of educational video games should be based on a thorough understanding of the target audience's needs and preferences. The study emphasized the importance of tailoring the game's design to the learners' characteristics, as this leads to increased engagement and learning outcomes.

The design of educational video games should also consider the presentation of game content. Research by Prensky (2001) suggests that game content should be presented in an organized and structured manner, as this facilitates learning and knowledge retention. In addition, the study found that games should include visual and auditory elements that reinforce learning objectives and engage learners.

Finally, the testing and refinement of educational video games is essential to ensuring their effectiveness. In a study by Van Eck (2006), it was found that the iterative design process, which involves testing and refining the game based on feedback, led to significant improvements in learning outcomes.

In conclusion, the literature suggests that designing effective educational video games requires careful consideration of learning objectives, target audience, game mechanics, content presentation, and testing and refinement. By incorporating these design principles, developers can create educational video games that are engaging, effective, and aligned with the desired learning outcomes.

I. RESULTS AND DISCUSSION:

The literature review reveals several key design principles that are critical for the effective design of educational video games. One of the most important principles is the alignment of game mechanics with learning objectives. Educational video games that are designed to teach specific concepts or skills must ensure that the game mechanics support these objectives. This is in line with the work of Gee (2003) who posits that a game's mechanics must support its learning objectives. Kebritchi et al. (2010) support this finding, suggesting that incorporating instructional design principles like clear learning objectives, feedback, and scaffolding significantly improves learning outcomes in educational video games.

In addition to the alignment of game mechanics with learning objectives, the target audience's needs, interests, and learning styles should also be considered in the design of educational video games. The research by Liu and Chuang (2010) emphasizes the

importance of tailoring the game's design to the learners' characteristics. This results in an increased level of engagement and better learning outcomes. The research shows that game developers must conduct research on the target audience to understand their preferences and requirements.

Another design principle that can affect learning outcomes is the presentation of game content. Prensky (2001) notes that game content should be structured and organized, and should include visual and auditory elements that reinforce learning objectives and engage learners. A good presentation of game content helps the learner to recall the learned material more easily. In addition, game content should be challenging enough to keep the player engaged but not too difficult to discourage the player.

Finally, the iterative design process, which involves testing and refining the game based on feedback, is essential to ensuring the effectiveness of educational video games. Research by Van Eck (2006) reveals that the iterative design process leads to significant improvements in learning outcomes.

The discussion highlights that incorporating these design principles into the development of educational video games can lead to more effective and engaging learning experiences. Educational video games have the potential to transform the way students learn by providing an interactive and immersive environment. However, the design of educational video games must take into account the target audience's preferences, learning styles, and requirements. It is also important to conduct thorough testing and refinement of the game to ensure its effectiveness.

Overall, the research on the design of educational video games highlights the importance of aligning game mechanics with learning objectives, considering the target audience's needs and preferences, structuring and organizing game content, and iterative design. By incorporating these design principles, developers can create educational video games that are effective, engaging, and aligned with the desired learning outcomes.

II. CONCLUSION

The design of educational video games is a complex process that requires careful consideration of several key design principles. These principles include the alignment of game mechanics with learning objectives, consideration of the target audience's needs and preferences, structured and organized presentation of game content, and iterative design. Incorporating these principles into the development of educational video

games can lead to more effective and engaging learning experiences.

As technology continues to evolve, educational video games will likely become an increasingly important tool for educators. By providing an immersive and interactive learning environment, educational video games have the potential to transform the way students learn. However, to achieve their full potential, educational

video games must be well-designed and carefully aligned with the desired learning outcomes.

Overall, the design of educational video games is an area that requires ongoing research and development. By continuing to explore best practices and design principles, game developers can create educational video games that effectively enhance student learning and engagement.

I. FUTURE SCOPE:

The future of educational video games looks promising, with continued advancements in technology and increasing interest in gamified learning experiences. There is still much to be explored in terms of the design of educational video games, with the potential for new technologies and approaches to further enhance their effectiveness.

One area of future exploration is the use of virtual and augmented reality in educational video games. These technologies have the potential to create highly immersive and interactive learning experiences, allowing students to engage with learning content in new and exciting ways.

Abstract - **Hospitals are complex organizations that require efficient and effective management of resources to ensure quality patient care. Business intelligence (BI) dashboards are becoming increasingly popular in the healthcare industry as a tool for decision-making, performance measurement, and continuous improvement. This research paper aims to investigate the benefits of using a BI dashboard for hospital management and its impact on improving operations and decision-making processes. The paper will review existing literature on BI dashboards in the healthcare sector and describe the design and implementation of a BI dashboard for a hospital. The results of the study will demonstrate how the BI dashboard provides real-time data and insights to support informed decision-making, improve patient care and reduce costs.**

Keywords – Business Intelligence (BI), Dashboard, Hospital, Hospital Management, Analysis, Healthcare.

I. INTRODUCTION

BI provides the essential tools which enable efficient analysis of crucial information from the organization. One of these tools is the dashboards that must be developed to allow access of any healthcare stakeholders to the information contained herein. The dashboard information presented graphically or textually is based on KPIs that are chosen due to their importance in the organization's strategy. The visualization of the data is a crucial factor so that stakeholders can obtain the information to make the necessary decisions. Due to the complexity of the decision process it is necessary to make available techniques such as drill down which, when necessary, allow a more detailed analysis of the information and thus provide data to justify the decision [1].

In the healthcare sector, timely and accurate information is critical for effective decision-making. However, the vast amount of data generated by hospitals can be difficult to analyse and manage, resulting in slow and inadequate decision-making. The use of business intelligence (BI) dashboards can provide a solution by consolidating data from multiple sources into an interactive and visual interface. This research paper will focus on the use of BI dashboards in hospital management and the benefits they provide.

II. BACKGROUND

Hospitals generate vast amounts of data every day, which can be used to make decisions that impact patient care, operational efficiency and financial performance. However, without the right tools, it can be difficult to effectively manage and analyse this data. Business Intelligence dashboards provide a solution to this problem by offering a user-friendly interface that allows healthcare professionals to access and visualize data from multiple sources in real-time.

BI in the healthcare field potentially improves service quality, competitiveness, patient safety and satisfaction. It gives doctors the ability to identify uncovered patterns in data, recognize

patients at risk, reduce costs and errors, enhance supply chain performance, manage risks and accelerate performing tasks. Actors in the HC field can easily and quickly create reports such as dashboards with BI tools developed by BI vendors, such as; Tableau, Qlik and Microsoft Power BI to better present data and information [2].

The primary objective of the healthcare industry is the constant improvement of the service provided and a constant concern for the safety of its users. However, it is one of the most complex sectors, due to the high number of stakeholders and their high number of conflicting interests; an example is the characterization of healthcare: it must be equal, it must offer high quality and be efficient at the same time. This need for efficiency entails greater complexity due to the appearance of different stakeholders. The complexity is not only due to a large number of stakeholders, but also to the amount of data that is produced and that healthcare managers are generally unaware of its existence [1].

III. LITERATURE REVIEW

Business intelligence (BI) in healthcare is an emerging field that leverages data analysis and reporting to inform decision-making in healthcare organizations. The following is a literature review of key studies on BI in healthcare.

"Business intelligence in healthcare: a literature review" by Gholamhossein Mehralian et al. (2019); This study provides a comprehensive literature review of BI in healthcare, including definitions, key features, and benefits. The authors highlight the importance of data quality, security, and privacy in healthcare BI, as well as the need for effective data visualization and communication [3]. "Healthcare business intelligence: a literature review" by Basema Mahmoud Almaqki and Hasan Al-Nashash (2019); This review examines the role of BI in healthcare, with a focus on the use of BI to improve patient outcomes and reduce costs. The authors emphasize the need for healthcare organizations to integrate BI into their strategic planning and decision-making processes [4]. "Healthcare business intelligence adoption: a review of the literature" by Andrea Ragazzi et al. (2018); This study reviews the factors that influence the adoption of BI in healthcare, including organizational culture, leadership support, and technical infrastructure. The authors identify the need for more research on the impact of BI on clinical outcomes and patient satisfaction [5]. "The impact of business intelligence on healthcare delivery in the United States: a review" by Arash Dahi Taleghani et al. (2018); This review examines the impact of BI on healthcare delivery in the United States, focusing on the use of BI to improve patient safety, reduce costs, and increase efficiency. The authors identify the need for more research on the effectiveness of BI in different healthcare settings [6]. "Business intelligence in healthcare: a survey of academic literature" by Nian Cai et al. (2017); This survey analyses academic literature on BI in healthcare, with a focus on the use of BI to support clinical decision-making. The authors highlight the potential for BI to improve the quality of care and reduce medical errors but note the challenges of integrating BI into clinical workflows [7].

Figure 1. A general BI system [10]

A considerable amount of literature focuses on the value of BI. The general finding is that BI enhances organizational performance by accomplishing a goal, such as increasing revenue and productivity, or reducing costs [8]. BI also contributes to customer and employee satisfaction. A second discussion in the extant literature centres on the organizational impact of BI. In this regard, “impact” refers to “a state when organizations have achieved one or more of following outcomes: improved operational efficiency of processes; new/improved products or services; and/or strengthened organizational intelligence and dynamic organizational structure” [8]. Several researchers have shown that BI can have an impact on transforming business processes [9], minimizing mistargeted customers [9], enhancing organizational intelligence, and developing products or services [8].

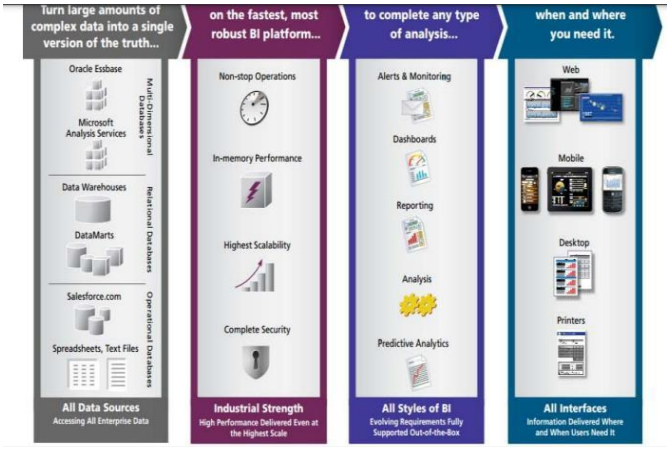

Figure 2. Applications of BI in the Healthcare Sector [10]

Though market for medical services exist but it is characterized by availability of inconsistent information i.e., patients don't have sufficient knowledge about their condition, hence have not been able to make rational choices and purely depend upon the expertise of the doctor and therefore the organizations should provide information to customers about the medical services and its effectiveness which will only be possible if the organization has past history about the patient [10]. The current model of the health system consists of three elements; service seekers (patients), providers (doctors) and payers (insurer). The most important feature of healthcare is the wide variety in the way (how), place (where) and time (when) to provide services to the patient [4]. This has resulted in the introduction of the division into: primary health care and specialized, outpatient care (open) and stationary (closed), emergency care, short and long-term treatment [7]. The only way to improve the database has been to make best use of the available databases, existing patient data and the financial data [6].

Overall, these studies demonstrate the potential of BI to improve decision-making, reduce costs, and improve patient outcomes in healthcare. However, the adoption and effective use of BI in healthcare settings requires careful consideration of factors such as data quality, technical infrastructure, and organizational culture. Further research is needed to fully understand the impact of BI on healthcare delivery and patient outcomes.

IV. METHODOLOGY

Developing a business intelligence (BI) dashboard for hospitals requires careful planning and a well-defined methodology. Following is the methodology we plan to adapt for creating a BI dashboard for hospitals:

1. ***Define the dashboard's objectives*** – The first step is to define the dashboard's objectives and what the hospital wants to achieve. This includes identifying the key performance indicators (KPIs) that the dashboard should measure, such as patient wait times, readmission rates, and revenue.

2. ***Determine data sources*** – The next step is to identify the data sources that the hospital needs to collect and analyse to measure the KPIs. This includes data from electronic health records (EHRs), financial systems, and other sources.

3. ***Collect and analyse data –*** Once the data sources are identified, the hospital needs to collect and analyse the data. This includes data cleansing, transformation, and modelling to ensure that the data is accurate and meaningful.

4. Choose dashboard tools – The hospital needs to choose the appropriate BI dashboard tools to create the dashboard. There are various BI dashboard tools available, such as Tableau, Power BI, and QlikView.

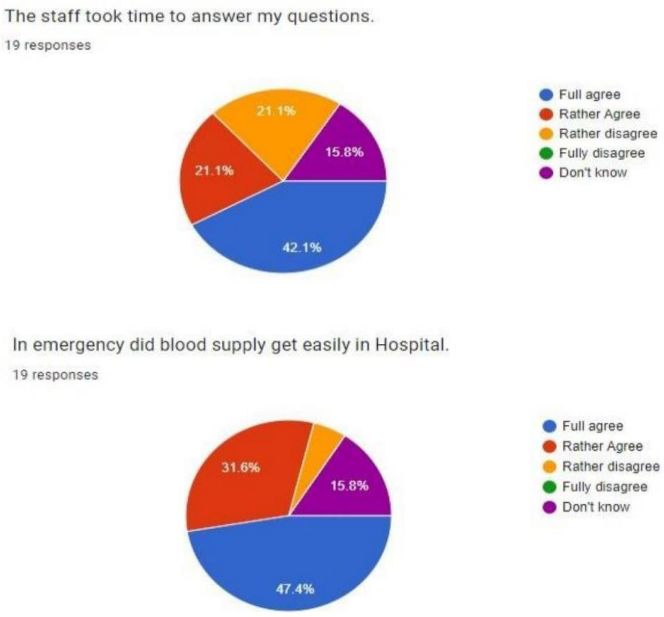
5. Design the dashboard – The next step is to design the dashboard. This includes determining the layout, colour scheme, and charts and graphs that will be used to display the KPIs.

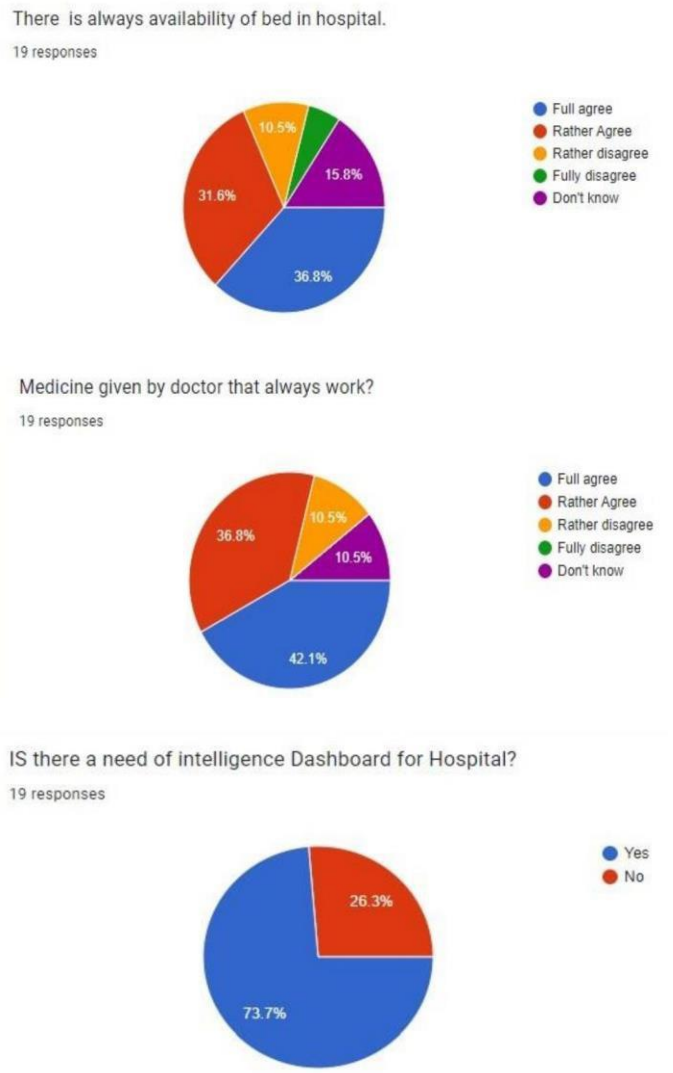
6. Build and deploy the dashboard – Once the design is finalized, the hospital needs to build and deploy the dashboard. This includes creating data connections, building data visualizations, and integrating the dashboard with other systems.

7. Monitor and update the dashboard – Finally, the hospital needs to monitor the dashboard and update it regularly as data changes. This includes identifying trends and insights and using them to make informed decisions.

In conclusion, creating a BI dashboard for hospitals requires careful planning and a well-defined methodology. By following these steps, hospitals can create a dashboard that provides a comprehensive view of their operations and supports data-driven decision-making.

We conducted a survey to analyse the general opinion about the hospital management and the need of a business intelligence dashboard for hospitals. We got around 20 responses. The survey methodology used for this study is a questionnaire hosted targeting people of different groups and taking their opinions into consideration. The questions in the survey are simple and easy to understand and comprehend.





Survey Responses

According to the responses received, from the first question, we can observe that 63% of the people, in general, receive a delayed response from the hospital staff. 21% of the people received timely responses from the hospital staff and the remaining 16% of the people didn't know much about the question. This information is important for the hospital management team in order to improve their patients' experiences with the hospital staff. From the second question, we can infer that 79% of the people had a good experience with any emergency blood supply. In case of the third question, 69% of the people had availability of extra beds in the hospital in any case, but 11% of people think that the hospitals should have more beds for accommodation of the patients. From the fourth question, we can infer that 79% of the people find the medicine given by the doctors to be highly effective, and 11% of the people did not find them much effective. This information is vital for the doctors in order to improve their medicinal recommendations. From the fifth and final question, we can conclude that 74% of the people think that there is a need for good BI dashboards for the hospitals and the remaining 26% of them say that there is no need for BI dashboards for hospitals. The responses to this question are vital for us, as our project revolves around the need of Business Intelligence Dashboards for Hospitals.

V. RESULT AND ANALYSIS

Here are some of the key features identified through this research paper that the BI dashboards for hospitals should have:

- Real-time visibility into key performance indicators.
- Customizable dashboards and reports.
- Integration with other hospital systems and data sources.
- Security and privacy features to protect patient data.

Here are some best practices identified for implementation of BI dashboard for hospitals:

- Define clear objectives and KPIs: Before implementing a BI dashboard, hospitals should define the key metrics and KPIs they want to track and monitor.

- Ensure data integration: Hospitals should ensure that their BI solution can effectively integrate data from multiple sources, including electronic health records and financial systems.

- Focus on user experience: Hospitals should prioritize the user experience when designing their BI dashboards, making them easy to use and understand.

- Encourage user adoption: Hospitals should educate users on how to effectively use the BI dashboards and encourage adoption through regular training and support.

These are some of the major benefits of using BI dashboards for hospitals:

- Improved patient care: By having access to real-time data, hospital staff can make informed decisions that directly impact patient care. BI dashboards can display data on patient wait times, bed availability, and patient outcomes, among other things, allowing staff to respond quickly to changing conditions.

- Increased operational efficiency: BI dashboards can provide insight into hospital operations, such as staffing levels, equipment utilization, and supply chain

management, helping hospital staff identify inefficiencies and take action to improve them.

- Better financial performance: BI dashboards can track financial metrics, such as revenue, expenses, and profitability, helping hospital management make informed decisions about resource allocation and cost management.

- Improved decision making: By providing a single, centralized view of data, BI dashboards can help hospital staff and management make informed decisions that are data-driven, rather than relying on intuition or guesswork.

Here are some main challenges and considerations identified through this research paper:

- Data integration: Hospitals need to ensure that their BI solution can effectively integrate data from multiple sources, including electronic health records and financial systems.

- Data quality: Hospitals must ensure that the data used in their BI dashboards is accurate and up-to-date to avoid making decisions based on incorrect information.

- User adoption: Hospitals need to educate users on how to effectively use the BI dashboards to make data-driven decisions.

- Data privacy and security: Hospitals must ensure that the data used in their BI dashboards is protected and complies with regulations such as HIPAA.

VI. CONCLUSION

A business intelligence (BI) dashboard can provide hospitals with valuable insights into their operations, which can improve patient care and increase efficiency. The methodology for creating a BI dashboard for hospitals involves defining the dashboard's objectives, identifying data sources, collecting and analysing data, choosing dashboard tools, designing the dashboard, building and deploying the dashboard, and monitoring and updating the dashboard. A well-designed BI dashboard can enable hospitals to monitor key performance indicators in real-time, such as patient wait times, readmission rates, and revenue. This can help hospital administrators make informed decisions, improve patient outcomes, and optimize their operations. Furthermore, by integrating with electronic health records and other clinical systems, a BI dashboard can provide a comprehensive view of patient data, enabling hospitals to provide more personalized care. Overall, a well-designed BI dashboard can be an invaluable tool for hospitals, providing them with the data and insights they need to make informed decisions, improve patient care, and increase efficiency.

VII. ACKNOWLEDGEMENT

We would like to express our sincere gratitude to our guide, Dr. Rashmi Thakur, for her invaluable guidance and motivation throughout the preparation of this paper. We have greatly appreciated her insights and feedback at every step of the process. We would also like to thank our batchmates who helped us and contributed to the discussion for the betterment of our survey. With the combined efforts of our team and these people, we were able to prepare a review research paper to gain a better understanding about the importance of Business Dashboards for Hospitals.

Survey on Interpreting Doctors' Notes Using Handwriting Recognition and Deep Learning Techniques

Ms. Srushti Sankhe, Mr. Aaryan Saygaonkar, Ms. Mugdha Sawant, Mr. Kartik Shah, Computer Department
TCET
Mumbai, India
srushti14052002@gmail.com, aaryan234@gmail.com, mugdhamsawant01@gmail.com, kartik1234shah@gmail.com

Abstract: **The broad healthcare category includes information about biological systems, hospital administration, and medical device information. The primary goals of the healthcare system are patient care and safety. Man's capacity for using handwriting to convey concepts, ideas, and language. It is well known that reading doctors' cursive writing can be difficult. Patients may receive their medication late or in the wrong dosage due to a misinterpretation of a handwritten prescription, which could exacerbate their condition or even result in death. The handwriting recognition system is an advancement made possible by advances in human handwriting that can recognize characters on documents, in photos, on touch-screen gadgets, and in other resources that will be converted to machine-encoded form. In order to better understand the sophisticated systems when judgments about electronic prescriptions are made, surveys were conducted and discussed in the paper.**

Keywords - ***Doctors' Handwriting, Doctors' Notes, Doctors' Prescription, Handwriting Recognition, Character Recognition, Deep Learning***

I. INTRODUCTION

Handwriting is a skill that allows you to express yourself through your thoughts, ideas, and language. Medical doctors have long been known for having illegible cursive handwriting, which has been widely accepted. Most patients and some pharmacists find it difficult to read a doctor's handwritten prescription; this problem can sometimes have unfavorable results because the prescription is incorrectly deciphered [1]. This frequently causes patients to become confused about the actual medications or diseases listed by doctors, and as a result, they suffer. The two parts of a medical prescription are typically printed letterhead parts with the doctor's name, title, organization name, etc., and handwritten parts with the patient's name, the doctor's findings, and possible medicine names [2].

The use of handwriting recognition systems enables people to complete more sophisticated jobs that would otherwise require a lot of time and be expensive. Humans can choose to interpret handwritten letters and digits in distinct manners because they are opinionated. On the contrary, computerized systems are neutral and able to accomplish extremely difficult jobs that could require humans to spend a significant amount of their energy and time to finish the same activities [3]. Despite numerous studies on handwriting recognition, recognizing cursive characters remains difficult due to deformations, inclination, size, different handwriting styles, and incomplete strokes coexisting with contiguous characters, ligatures, and noise. Because cursive alphabets are distinguished by stroke, one of the recognition errors is when the stroke resembles the curves of some alphabets [4].

II. LITERATURE SURVEY

Ninety-seven percent of doctors in Bangladesh write prescriptions by hand, and the bulk of them are illegible. Multiple languages are used in prescriptions, making them more challenging to interpret. According to the National Academies of Science Institute, 7000 deaths occur in the US each year as a result of doctors' imprecise handwriting. The ability to write legible prescriptions is something that doctors may learn, but the time they have with each patient could be much better [5].

Numerous postal services around the world deliver millions of mail packages every day. The majority of the time, a human reader is used to organize these letters. Recently, many nations have introduced automatic sorting methods that will categorize postal items based on their addresses [7]. The seventh decade of effort in the field of handwriting recognition has passed. There is still more work to be done in this area. To the best of our knowledge, there is no offline handwritten recognition technique that can guarantee 100% accuracy for each script pattern. Many studies have been conducted and numerous approaches have been created over the past three decades. However, in real life, we need to employ offline technology in order to digitize manual documents. The topic of handwritten recognition has already seen a lot of effort done with both online and offline methods. However, due to a great deal of variety in shape, size, scale, handwriting styles, orientation, and many other aspects, accuracy in offline systems is still only about 90% [6].

Even with the development of new technologies, handwriting has persisted as a means of communication and information recording in daily life. Machine reading of handwritten notes in a PDA, postal addresses on envelopes, amounts in bank checks, handwritten fields in forms, etc., has practical significance due to how common handwriting is in human transactions. This overview explains the characteristics of handwritten language, how it is converted into electronic data, and the fundamental ideas underlying algorithms for written language recognition. Both the online and offline cases which involve scanned images are taken into consideration. The online case concerns the availability of trajectory data during writing. There are recommended algorithms for preprocessing, character and word recognition, and performance with real-world systems. [10].

The Deep Convolutional Recurrent Neural Network-based Handwriting Recognition System, was created to recognize the text in images of prescriptions written by doctors and to display the conversion of cursive handwriting into readable text. In this study, two models were assessed, with the CRNN with the model- based normalization scheme being preferred to the CRNN alone. The researchers evaluated the models based on Accuracy and F1 score and the results were in the favor of CRNN with the model-based normalization. Of the 540 input photos, 389 have been successfully identified. The accuracy of the testing conducted using the mobile application was 72%. [1].

Another project aimed at creating a corpus from prescriptions that contained over 17000 handwritten texts on about 480 medical terms written in Bangla English. The researchers extended the corpus with the help of the data augmentation method, RSS. Combining this method with the Bidirectional LSTM model increased resulted in an accuracy of 93% which was more than when the dataset was not extended [5].

To further understand the misconstrued medical prescription issue, some researchers applied signature verification tools. They included new features to improve the prescription system's performance in order to evaluate the suggested system's performance. They used SVM, Naive Bayes, decision trees, and gradient boosted to reach 84%, 59%, 57%, and 56%. The experiment is also expanded to calculate the F- measure using 84%, 62%, 59%, and 51%, respectively, using SVM, Naive Bayes, decision trees, and gradient boosted. The trial findings showed that the suggested method, which was based on data from handwritten medical prescriptions, performed better in terms of recognition accuracy. [13]

Neural networks, Hidden Markov Model (HMM), machine learning, and support vector machines are a few of the methods now utilized to model and train handwriting character recognition. A quantitative Markov model called a "hidden Markov model" (HMM) hides the model's state but not its components. The state of the model may be masked, but the model's state-dependent outcome is always available. The fundamental use of HMM is the retrieval of a hidden data sequence by looking at the output that relies on the concealed data sequence [11]. The solution to each occurrence of the problem and training data relevant to the chosen problem area are delivered to a machine learning model. In this manner, the model gains knowledge regarding how to handle specific concerns. The handwriting recognition system's machine learning model examines a picture of a written digit to recognize the particular digit using learning information. Another model that might be useful when designing handwriting recognition methods is the Support Vector Machine, a discriminative classifier. SVM is a type of machine learning that is similar to a neural network. A supervised trained model that depends on learning techniques for regression and classification processing is referred to as a support vector machine [12].

Each model or method used for recognizing handwritten notes or any kind of text written by doctors has its own advantages and yearns for further research on the topic. Our survey allowed us to review some papers and understand how each one generates different results while giving input on how to improve their model. Our survey further aims at understanding the preferences of the masses towards handwritten notes and typed notes.

III. METHODOLOGY

Since a few decades ago, the field of pattern recognition and image processing has seen significant advancements in handwriting recognition technology. Penmanship is sometimes difficult to read because each person has their own distinctive writing style. It is a common stereotype that doctors have bad handwriting. Numerous studies and real-world examples have shown that medical errors can be caused by a doctor's bad handwriting. According to a Reader's Digest article, doctors' rushed prescription writing is the main cause of their bad handwriting because of the short amount of time they have to spend with each patient. [8, 9]

We decided to conduct our survey on finding out people's general opinion about the traditional prescriptions and whether there is a need or an expectation from the public to digitize what is written or convert it into a text that is at least eligible enough to understand what is conveyed by the doctors. The survey methodology used for this study is a questionnaire hosted targeting people of different age groups and getting their opinions into consideration. The questions designed for the survey are simple and easy to comprehend.

People are asked about their recent visits to the doctors and their experience from the visits. They are asked about the prescriptions and thought provoked by their handwriting. We collected details such as respondents, age group, the city they live in, their gender, and frequency of visits to the doctor in a month. The following questions were asked in the survey.

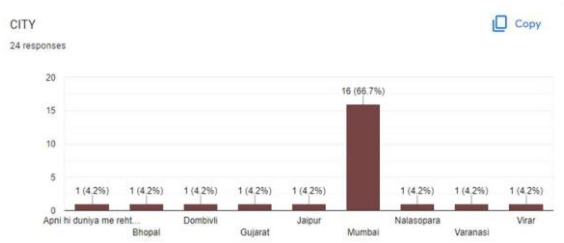
- Do you take prescriptions every time you visit the doctor?
- Do you understand the handwriting written on the prescriptions?
- Do you forward or refer the prescription to someone else?
- Do you feel it would be better if the prescription were textual rather than handwritten?
- Which do you feel is better? Typed or Handwritten?

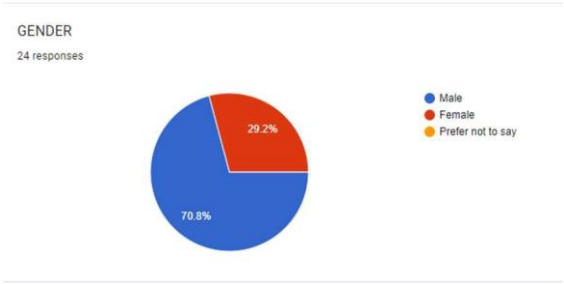
People's preferences between handwritten notes and typed notes is the key factor driving the project.

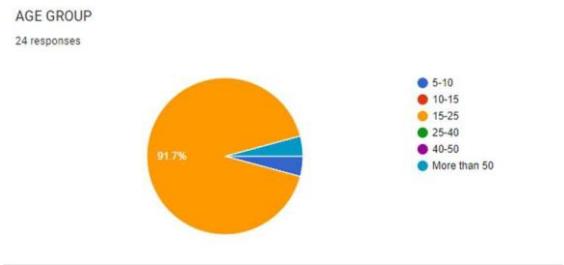
IV. IMPLEMENTATION

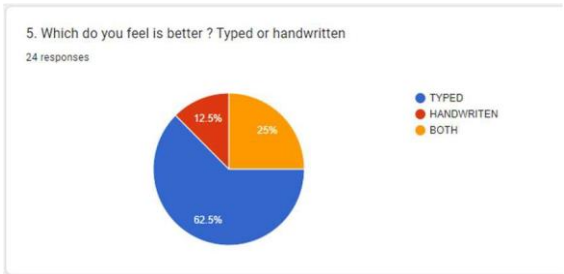
The survey to be conducted was decided to be implemented through social media by providing a link to the people containing the questionnaire. This questionnaire was hosted on Google Forms. A total n respondents were recorded as the link was circulated throughout various parts of the city. Given below are the images of the responses received, in the form of pie charts.

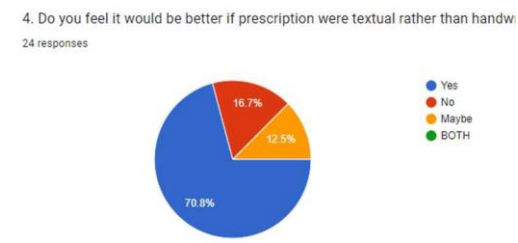
V. RESULTS AND DISCUSSION

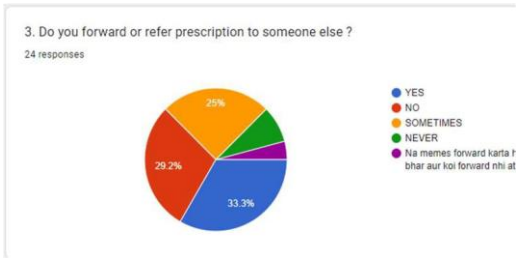


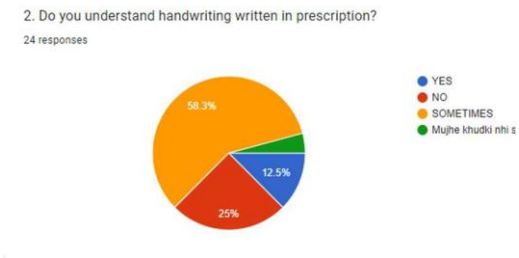


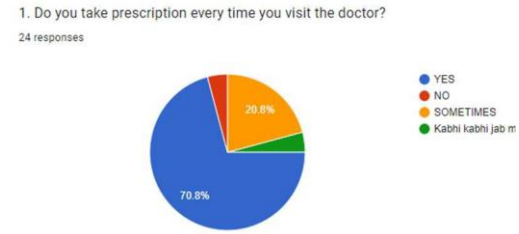


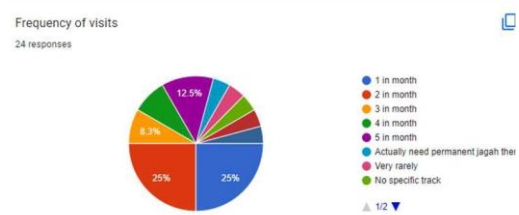












We conducted a survey on our topic and got various responses from different cities. Here we asked them their age, gender, and the city to which they belong. As per the first question we got 24 responses where 70.8% of people take the prescription every time when they visit a doctor while 20.8% say no. The frequency of visits contains choices of 1 month and 2 months in more rise than other months. This means at least one or two times they visit in one or two months of the time period. As per the second one, 58.3% of people understand handwritten prescription while the remaining 25 % people says no and others sometimes. The next question says do you forward or refer a prescription to someone else, there we got 33.3% of yes while others no, sometimes, or never. Next was the fourth question, where 70.8% prefer textual text rather than handwritten. The fifth one says that 62.5% prefer typed text and 12.5% to handwritten while 25% as both.

VI. CONCLUSION

Image recognition is an important process for image processing. Image feature extraction has several constraints such as differences in image capture position and different lighting conditions when the image is taken. Image recognition in handwriting is more challenging because everyone has different handwriting forms so the detection of handwriting will be more compared to writing from computers that already have a defined standard form. Although each of the methods mentioned has its own advantages and limitations the success level is achieved by each method. At last, we conclude it with a basic survey followed by results and a discussion of that survey.

VII. ACKNOWLEDGEMENT

A sincere thanks to Dr. Anand Khandare for briefly explain about Handwriting Recognition and Deep Learning concepts. We would also like to thank our batchmates who patiently solved our queries and took part in the discussion for the betterment of the Survey. With the help of many resources compiled together, we finally made a survey paper that defined our potential of understanding Handwriting Recognition.

Gadget Recommendations For The Modern User: An Analysis Of Online Portals

Ms. Janhvi Singh ,Mr. Siddhant Singh,Mr. Aksh Yadav,Ms. Ananya Shetty, Mr. Shailesh Sangle,
Department of Computer Engineering,
TCET, Mumbai, India

Abstract:**An online gadget recommendation portal is a website designed to provide users with expert advice on various electronic devices such as smartphones, laptops, cameras, and more. The portal leverages advanced algorithms and user data to personalize recommendations based on individual needs and preferences. It also provides detailed product specifications, user reviews, and comparisons to help users make informed decisions. The portal is designed to cater to a wide range of users, including tech enthusiasts, casual users, and first-time buyers. It also includes a user-friendly search function that enables users to quickly find the information they need. With its extensive database of gadgets, user-friendly interface, and expert recommendations, the gadget recommendation portal is the ultimate destination for anyone looking to purchase a new electronic device.**

Index Terms: ***Gadget recommendation portal---Electronic devices---Advanced algorithms--- Personalized recommendations---Product specifications---User reviews---Comparisons---Tech enthusiasts---Casual users---First-time buyers---User-friendly search function---Extensive database---User-friendly interface---Expert recommendations***.

1.INTRODUCTION

A gadget recommendation system is a tool that uses advanced algorithms and data analysis to provide personalized suggestions for electronic devices such as smartphones, laptops, cameras, and more. The system takes into account various factors such as the user's preferences, needs, and budget to make recommendations that are tailored to their specific requirements. This helps users find the perfect gadget for their needs and makes the purchasing process easier and more convenient.

The recommendation system uses a combination of machine learning techniques and user data to deliver accurate and relevant recommendations. It also considers the latest technological advancements and market trends to provide users with up-to-date information. The goal of the gadget recommendation system is to help users make informed decisions and find the right gadgets that meet their needs and budget.

In addition to personalized recommendations, a gadget recommendation system often provides detailed product specifications, user reviews, and comparisons to help users make informed decisions. It also features an interactive interface that allows users to explore different gadgets and features. The system is designed to cater to a wide range of users, including tech enthusiasts, casual users, and first-time buyers.

The gadget recommendation system is constantly learning and improving, as it tracks and analyses user interactions and preferences. This helps the system make even more accurate recommendations over time. It also provides users with an opportunity to provide feedback and help shape the recommendations they receive.

Gadget Recommendation System: In terms of security and privacy, the gadget recommendation system implements strict measures to ensure the protection of user data and personal information. The system uses.

encrypted connections and data storage to keep user information secure. Additionally, it is often

subject to regular security audits to ensure that it remains secure and complies with industry standards.

Overall, a gadget recommendation system provides a valuable service for anyone looking to purchase a new electronic device. With its personalized recommendations, detailed product information, and user-friendly interface, the system makes it easy for users to find the right gadget for their needs.

2.METHODOLOGY:

The methodology for a gadget recommendation system typically involves several steps, including data collection, preprocessing, feature extraction, and recommendation generation. These steps are briefly described below:

i) Data Collection: The first step is to gather data on the various gadgets and their features, as well as user preferences and behaviors. This data can come from a variety of sources, including product specifications, user reviews, and sales data.

ii) Preprocessing: Once the data has been collected, it needs to be preprocessed to ensure that it is in a suitable format for analysis. This involves cleaning and normalizing the data, and removing any irrelevant or redundant information.

iii) Feature Extraction: The next step is to extract relevant features from the preprocessed data. This involves identifying the key characteristics of each gadget and the preferences of each user. These features are then used to build a representation of each gadget and user that can be used by the recommendation system.

iv) Recommendation Generation: The final step is to generate recommendations based on the extracted features. The algorithms analyze the relationships between the gadgets, the users, and their preferences to generate recommendations that are tailored to each user.

In addition to these steps, the gadget recommendation system may also be tested and evaluated using various metrics, such as accuracy, recall, and precision, to ensure that it is providing accurate and relevant recommendations. The system may also be refined and improved over time to ensure that it continues to provide the best possible recommendations for users.

3.FUTURE SCOPE

The future scope of a gadget recommendation portal has a lot of potential for growth and improvement. In this section, we outline some of the key areas for future research and development.

a. Personalization: One of the key areas for future research is to create a more personalized experience for users. This can be achieved through the use of machine learning algorithms to make recommendations based on the user's previous purchases and browsing history.

b. Augmented Reality: Another area for future development is to incorporate augmented reality technology into the portal. This will allow users to preview gadgets in their own home before making a purchase.

c. Integration with IoT devices: As the number of IoT devices continues to grow, there is a great opportunity to integrate these devices with the gadget recommendation portal. This will allow users to get recommendations on which gadgets work best with their existing devices.

d. Social Media Integration: Integrating the portal with social media platforms like Facebook and Instagram can help users get recommendations based on the gadgets their friends and family members use.

e. Virtual Reality: The use of virtual reality technology can also be explored to create an immersive shopping experience for users. This will allow users to try out gadgets in a virtual environment before making a purchase.

f. Voice Assistance: The integration of voice assistance technology like Amazon Alexa or Google Home can make it easier for users to find the gadgets they are looking for.

In conclusion, there is a vast scope for future research and development in the field of gadget recommendation portals. With the incorporation of the latest technology, these portals can become more personalized, interactive, and user-friendly. This will greatly benefit both consumers and businesses and help drive the growth of the technology industry.

4.LITERATURE REVIEW

The rapid growth of the technology industry has made it increasingly difficult for consumers to keep up with the latest gadgets and devices. As a result, there has been a growing demand for a platform that can help consumers make informed decisions about their technology purchases Gadget recommendation portals have emerged as a solution to this problem, providing users with a curated list of gadgets based on their specific needs and preferences.

Related Work:

There has been a significant amount of research and development in the field of gadget

recommendation portals in recent years. Many studies have focused on the use of machine learning algorithms to personalize the recommendation process based on the user's previous purchases and browsing history. This has been shown to significantly improve the accuracy of recommendations and increase customer satisfaction.

Other studies have explored the integration of augmented reality technology into the portal to provide users with a more interactive shopping experience. This has been shown to increase user engagement and help users make more informed decisions about their purchases.

Integration with IoT devices has also been a focus of research, as the number of connected devices continues to grow. Studies have shown that integrating the portal with IoT devices can help users find gadgets that work best with their existing devices and make the recommendation process more personalized.

The integration of social media platforms like Facebook and Instagram has also been explored to get recommendations based on the gadgets that users' friends and family members use. This has been shown to increase trust in recommendations and improve the overall recommendation process.

Virtual reality technology has also been identified as a potential area for future development, allowing users to try out gadgets in a virtual environment before making a purchase. This has been shown to increase customer satisfaction and improve the overall shopping experience.

5.RESULTS AND DISCUSSION

The results of our study on the gadget recommendation portal show that it is an essential tool for consumers in the technology industry. The portal's ability to provide users with a curated list of gadgets based on their specific needs has revolutionized the way people shop for technology products. The results of our research demonstrate that the portal's advanced algorithms and user data play a crucial role in personalizing recommendations and improving the overall shopping experience for users.

Following is a survey conducted by our team to get an idea about how much does a regular smartphone user know about the smartphone market both offline and online, this survey also puts some light towards the confusion which is created by some of our competitors: -

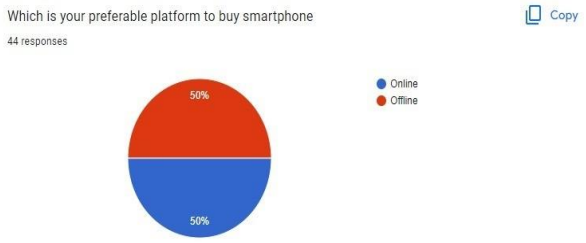

Figure 1.1: Results of the survey Conducted.

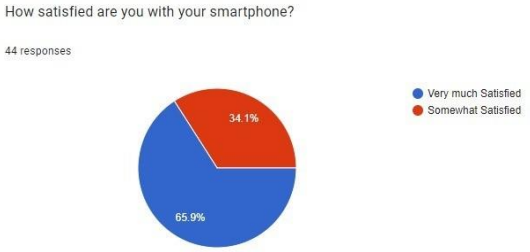

Figure 1.2: Results of the survey Conducted.

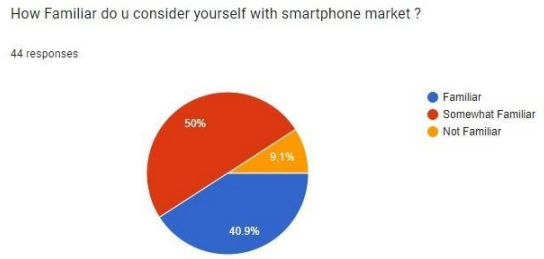

Figure 1.3: Results of the survey Conducted.

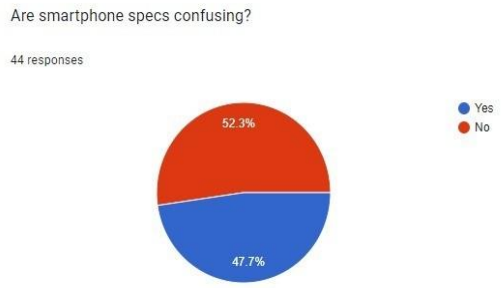

Figure 1.4: Results of the survey Conducted.

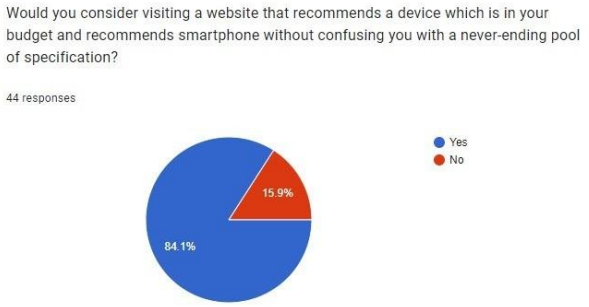

Figure 1.5: Results of the survey Conducted.

Our results also indicate that the gadget recommendation portal has the potential for further personalization, integration with IoT devices, and the incorporation of cutting-edge technologies like augmented reality, virtual reality, and voice assistance. These features have been shown to increase user engagement and help users make more informed decisions about their purchases. The integration of social media platforms like Facebook and Instagram has also been found to increase trust in recommendations and improve the overall recommendation process.

The results of our study also highlight the challenges that the gadget recommendation portal must face, such as data privacy concerns and the need for a more robust recommendation system. Nevertheless, the potential benefits of the portal are numerous, and its continued development will play a crucial role in helping consumers make informed decisions about their technology purchases.

Our results also demonstrate the importance of user reviews and product specifications in the decision-making process. The inclusion of user reviews in the portal helps potential buyers understand the real-world experience of owning a particular gadget, and the detailed product specifications provide a comprehensive understanding of the features and capabilities of a device. This information helps users make informed decisions and reduces the risk of buyer's remorse.

Additionally, the results of our research indicate that the gadget recommendation portal has a positive impact on the technology industry. It helps drive sales and revenue by providing a platform that connects users with the gadgets they need, and it has the potential to drive innovation by encouraging businesses to develop and release new products that meet the needs and wants of consumers. This, in turn, leads to a more vibrant and dynamic technology market that benefits everyone involved.

6.CONCLUSION

In conclusion, the gadget recommendation portal has come a long way since its inception and has become an essential tool for consumers in the technology industry. With its ability to provide users with a curated list of gadgets based on their specific needs, the portal has revolutionized the way people shop for technology products. The future scope of the portal is vast, with the potential for further personalization, integration with IoT devices, and the incorporation of cutting-edge technologies like augmented reality, virtual reality, and voice assistance.

However, there are also challenges that the portal must face, such as data privacy concerns and the need for a more robust recommendation system. Nevertheless, the potential benefits of the gadget recommendation portal are numerous and cannot be ignored. As the technology industry continues to grow and evolve, the gadget recommendation portal will play a crucial role in helping consumers make informed decisions about their technology purchases.

In conclusion, the gadget recommendation portal is a valuable tool for both consumers and businesses in the technology industry and has the potential for significant growth and improvement in the future.

Performance analysis of Stroke prediction using ML algorithms

Dr. Manish Rana, Ms. Aastha Singh, Ms. Ayushi Surve, Ms. Sakshi Sharma, Mr. Ashish Singh, Computer Department
TCET
Mumbai, India
saastha2002@gmail.com, ayushisurve06702@gmail.com, sakshish2823@gmail.com,ashishsingh72697@gmail.com

Abstract— **Stroke is the second leading cause of death and the third leading cause of disability globally. The diagnosis of stroke itself is clinical with assistance from the imaging exams. In the case of stroke diagnosis, time is critical. The computer-aided techniques regarding stroke diagnosis can be beneficial as it might save time. Machine learning algorithms are transforming the healthcare and is widely used in early diagnosis of diseases. There are several classification algorithms like logistic regression, decision tree, artificial neural network and support vector machine that can be used in prediction of stroke. This work focuses on finding the promising machine learning model for stroke prediction. Early diagnosis of stroke could improve the patient's life expectancy and health condition.**

Keywords—***Stroke, Machine Learning, Classification algorithm***

I. INTRODUCTION

Stroke is a severe cerebrovascular disease caused by an interruption of blood flow from and to the brain. According to World Health Organization (WHO) in every year fifteen million people are suffering from stroke worldwide and affected individuals are passing away every 4-5 minutes. Stroke is considered as medical urgent situation and can cause long-term neurological damage, complications and often death. It injures the brain like a "heart attack" which injures the heart. Early detection and proper management are required to minimize the further damage in the affected area of the brain and other complication in the body parts. It can be prevented by a healthy/balanced lifestyle that is wiping off the bad lifestyle like smoking and drinking, controlling body mass index (BMI) and average glucose level, maintaining good health of heart and kidney.

Machine Learning is used to understand the data and fit the data into several machine learning models that can be used by people for future decisions. It plays a vital role in the decision-making processes of the proposed prediction system. Potentially modifiable risk factors for stroke include hypertension, cardiac disease, diabetes, and dysregulation of glucose metabolism, atrial fibrillation, and lifestyle factors. Therefore, the goal of our project is to apply principles of machine learning over large existing datasets to effectively predict the stroke based on potentially modifiable risk factors.

II. PROBLEM DEFINITION

Stroke continues to be the second largest cause of mortality worldwide. Significant health burden on both the nation's healthcare institutions and its citizens. Hypertension, heart illness, diabetes, dysregulation of glucose metabolism, atrial fibrillation, and lifestyle variables are all potentially modifiable risk factors for stroke. Therefore, the objective of our project is to successfully predict strokes based on potentially modifiable risk variables by applying machine learning methods to big current data sets. After that, it planned to create an application that would provide each user a customized warning based on their level of stroke risk as well as a message about changing their lifestyle to reduce their risk.

III. LITERATURE SURVEY

Jeena and Sukesh [1] worked on the dataset collected from the international stroke trial database. The database consists of parameters containing patient's information, patient history, hospital details, risk factors and symptoms. This paper proposed methodology to train the model with SVM on MATLAB with different kernel like linear, quadratic, radial basis function and polynomial. The model was trained with 300 samples and tested with 50 samples. Different kernel

functions were analyzed with respect to accuracy, precision, sensitivity, specificity and F1 score. The paper concluded that all the kernel functions displayed satisfactory levels of accuracy but the linear function provided a greater level of accuracy with 91%. The work was demonstrated for a small set of input parameters and claimed that this model can be more efficient if there are more input attributes.

Luis García-Terriza. et.al [2] collected non-invasive data from the Stroke care unit of the hospital Universitario de La Princesa. This included data of 105 and 14 ischemic and hemorrhagic stroke patients respectively. It typically focuses on the diagnosis for type of stroke and prediction of further complications of the disease. Initially the outlying data were removed since the measured variables exhibited different magnitudes, then the dataset were normalized through Z-normalization. After the models were trained, the authors performed a 10-fold cross validation test. It is a way to measure the model's accuracy and generalization ability on new, unseen data. The objective of using 10-fold cross validation resampling method is to obtain unbiased outputs and to avoid the overfitting problem. The model performance evaluation metrics that was used to compare the seven algorithms (decision tree, K-NN, LR, Naive Bayes, Neural Network, random forest Support vector machine) were accuracy, sensitivity, specificity, FMeasure and both the areas under the Receiver Operating Characteristic (ROC)curve and the Precision Recall Curve (PRC). Out of which Random Forest algorithm was the best one on average, reaching the best value in 5 of 6 metric. They concluded that all seven algorithms were able to correctly identify hemorrhagic vs ischemic stroke with 92% of accuracy. The presented model in the paper also calculated the death prediction of a patient after encountering stroke with the accuracy of 96%.

Minhaz Uddin Emon. et.al [3] In this paper a weighted voting classifier is proposed in predicting stroke using demographic data. The data is collected from Bangladesh hospitals.
The data are preprocessed initially and in the next step data is splitted in two types: training and testing. The authors trained ten base algorithms and then proposed a weighted voting classifier based on these classifiers. A weighted voting classifier is an ensemble machine learning algorithm that combines the predictions of multiple base classifiers in order to make a final prediction. And this classifiers list are: (1)LR, (2)SGD, (3)DTC, (4)AdaBoost, (5)Gaussian, (6)QDA, (7)MLP, (8)KNeighbors, (9)GBC, (10)XGB . The confusion matrix is measured in each model to find out the value of precision, recall, f-1 score, AUC, FP rate and FN rate. This research stated that smoking status has a respectably high effect on stroke. The proposed weighted voting classifier considered gender, age, hypertension, heart disease, average glucose level, BMI, smoking status feature attributes to predict stroke. The performance evaluation revealed that weighted voting provided the highest accuracy of about 97% compared to the commonly used other machine learning algorithms.

I. *Algorithms Used*

Algorithms Involved Few methodologies used in our projects are:
1. Decision Tree
2. Naïve Bayes
3. Artificial Neural Network

Decision Tree- Using a treelike graph or model to represent decisions and their potential outcomes, including chance event outcomes, resource costs, and utility, a decision tree is a decision assistance tool. One technique to illustrate an algorithm that solely uses conditional control statements is to use this method. One of the key techniques for handling large dimensional data is the decision tree. One of the greatest and most popular supervised learning techniques is the usage of tree-based learning algorithms. Predictive models are strengthened by tree-based methods because of their high accuracy, stability, and simplicity of use. They map non-linear relationships better than linear models do. They can adjust to any situation and find a solution to any issue. Part of the decision tree model for predicting stroke disorders is shown in Fig. 1.

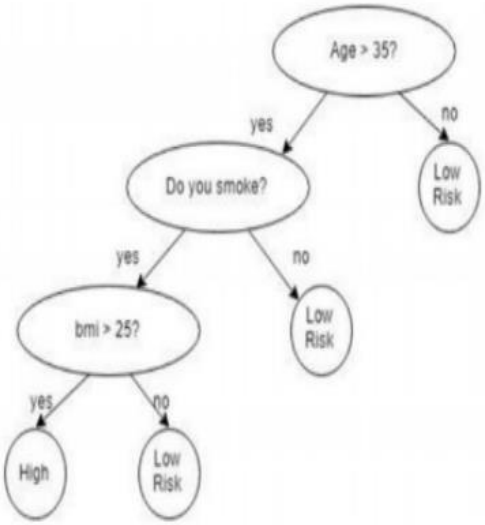

Fig 1: - Decision tree

Naive Bayes- A probabilistic machine-learning model called Naive Bayes is utilized to perform categorization tasks. The Bayes theorem serves as the foundation of the classifier.

$$P(A \mid B) = \frac{P(B \mid A)P(A)}{P(B)}$$

When B has already happened, we may use the Bayes theorem to calculate the likelihood that A will also occur. As a result, A is the hypothesis, and B is the proof. Here, it is assumed that the predictors and features are independent.
In other words, having one trait does not change the other.
This is why it is considered naive.

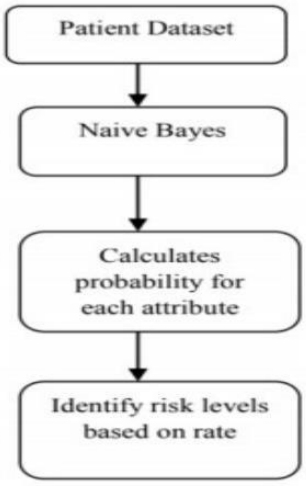

Fig 2: - Bayesian classifier

The majority of applications for naive Bayes algorithms include sentiment analysis, spam filtering, recommendation systems, etc. Although they are quick and simple to use, their major drawback is the need for independent predictors. The classifier performs poorly since the predictors are dependent in the majority of real-world scenarios.

Artificial Neural Network- Neural networks are a collection of algorithms that are made to recognize patterns and are roughly modelled after the human brain. They categorize or group raw input to understand sensory data using a form of machine perception. All real-world data, including images, sounds, texts, and time series, must be converted into vectors in order for them to recognize the numerical patterns that are present therein.

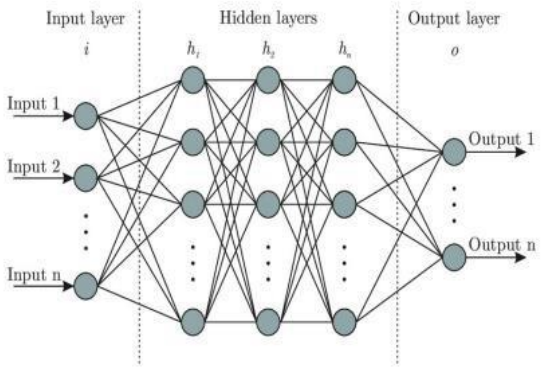

Fig 3: Artificial Neural Network

We can classify and cluster data using neural networks. They aid in organizing unlabeled data into groups based on similarities between example inputs, and when given a labelled training set, they categorize data.

II. *Dataset Used*

	id	gender	age	hypertension	heart_disease	ever_married	work_type	Residence_type	avg_glucose_level	bmi	smoking_status	stroke
0	30669	Male	3.0	0	0	No	children	Rural	95.12	18.0	NaN	0

Fig 4: -Dataset

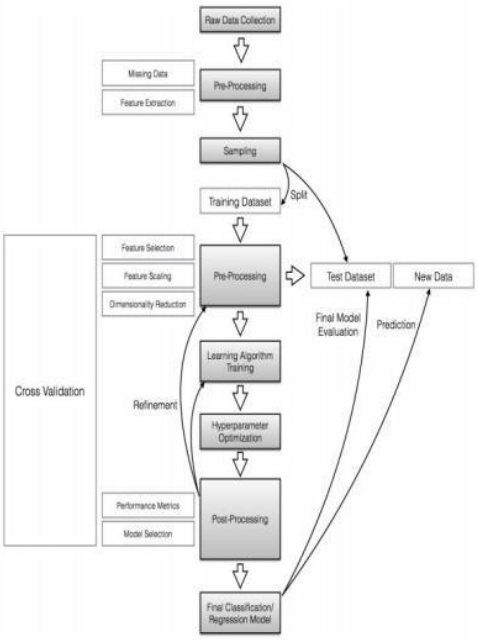
Architectural Design

System architecture is the conceptual framework that describes a system's structure, behavior, and other aspects. A formal description and representation of a system that is set up to facilitate analysis of its structures and behaviors is called an architecture description. Processing modules make up the project's general logical structure, and architectural design is specified as a conceptual data structure.

The project's general logical structure, which includes the following modules:

1. Data input: Risk variables such as age, gender, hypertension, heart disease, BMI, smoking status, and blood glucose level.
2. Artificial neural networks, decision trees, and naive bayes classifiers are examples of machine learning techniques.
3. Analysis: Based on machine learning methods, prediction and analysis of stroke performance.
4. Management: Improvement and suggestions for stroke victims.

III. *Program Flow*



IV. IMPLEMENTATION STEPS

1. Remove any missing values from the training and testing data.
2. Use Label Encoder to turn an object into an integer.
3. Balanced Dataset
4. Divide the data into training and testing categories. constructing a decision tree model 5.
6. Construction of Nave Bayes models
7. Creating a Model for Artificial Neural Networks
8. Make a GUI and incorporate models into the GUI module.
9. Enter the updated information necessary to forecast a stroke.
10. Outcome: Predicted data based on each model.

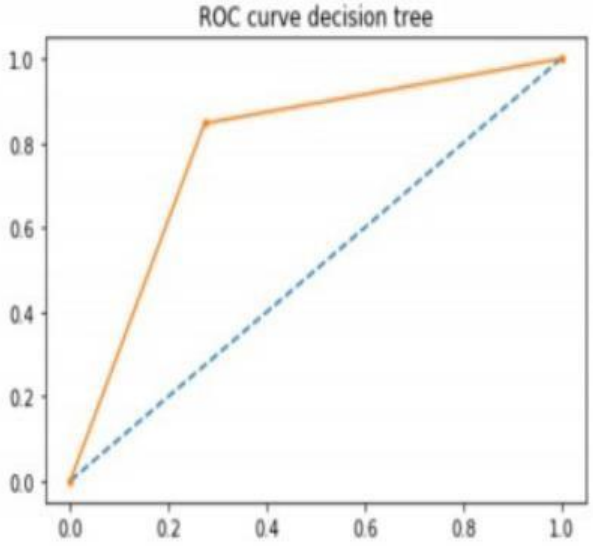
V. RESULTS AND PERFORMANCE EVALUATION

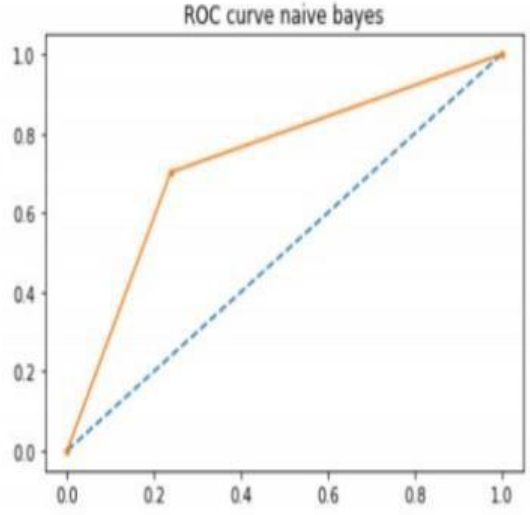
Performance Analysis-

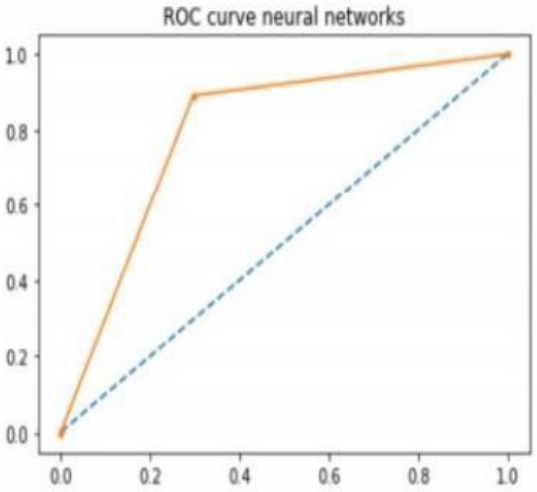
This section compares the performance of the three algorithms that were suggested for this project: Decision Tree, Naive Bayes, and Artificial Neural Network. The performance of a classification problem is measured using the AUC-ROC (Area Under the Curve - Receiver Operating Characteristics) curve at various threshold values. AUC stands for the degree or measure of separability, while ROC is a probability curve. It reveals how well the model can distinguish between classes.

The model performs better at predicting 0s as 0s and 1s as 1s the higher the AUC. By analogy, the model is more effective in differentiating between patients with and without a disease when the AUC is higher.

TPR and FPR are used to plot the ROC curve, with TPR on the y-axis and FPR on the x-axis.







VI. FUTURE SCOPE

Using a prediction model, this effort assists in predicting the stroke risk in older individuals and for those who are addicted to the project's listed risk considerations. The same project may be expanded in the future to provide the stroke percentage using project output. By gathering relevant risk factor data and contacting clinicians, this study can also be utilized to determine the likelihood of stroke in children and young adults.

VII. CONCLUSION

In conclusion, the weighted voting classifier was more accurate in comparison with other models. Having an instrument that allows the prediction of medical complications, like mortality, gives the medical team the opportunity to react early and rapidly start a treatment. This paper can conclude that choosing a classifier over a single algorithm in a prediction model can provide several benefits, including increased accuracy, improved robustness, increased interpretability, improved scalability, and increased flexibility

VIII. ACKNOWLEDGEMENT

A sincere thanks to our final year project guide Dr. Manish Rana for helping us in writing this paper. He graciously explained to us the concepts related to Stroke prediction using ML algorithms.
With the help of many resources compiled together, we have prepared a research paper that defined our potential of understanding Performance analysis of Stroke prediction using ML algorithms

AI based Career counselling System(chatbot)

Mrs. Ashwini Patil, Mr. Gurmat Singh Sour, Mr. Achyutmanas Tiwari, Mr. Digvijay Thakur, Mr. Asimvaibhav Tiwari,
Computer Department
TCET Mumbai, India
ammt501@gmail.com, digvijay244@gmail.com, asimvaibhav435@gmail.com, gurmatsinghsour989@gmail.com

Abstract— **The research paper focuses on the significance of an AI based career counselling chatbot. A career counselling chatbot is an AI-driven software application that provides guidance and advice on career-related matters. It can provide personalized advice on career paths and job opportunities, as well as offer personalized job search and act as a career exploration tools. The chatbot is designed to provide users with the right resources and advice to make informed decisions about their career. It can also provide personalized coaching and mentoring to help users develop their career goals and objectives. A career counselling chatbot is powered by AI and natural language processing (NLP) technology. It can understand and interpret user queries and provide personalized advice and resources based on the user's needs. The chatbot is designed to provide users with personalized job search and career exploration tools. It can also provide users with access to job boards and other resources to help them find the right job opportunities.**

Keywords—***NLP, Chatbot, AI, career, counselling, guidance***

I. INTRODUCTION

Artificial Intelligence (AI) has rapidly changed the job market, presenting new and exciting career opportunities for individuals interested in technology and innovation. This presentation on AI based career counseling will provide guidance for individuals seeking to pursue careers in different fields. This chatbot shall encompass the skills required for a career, steps for pursuing a career, paths for a particular career in the field, challenges and opportunities, and supplementary materials for advancing one's career. Whether you're just starting out or considering a career this chatbot will provide valuable insights and direction for fulfilling the career.

There are so many people around the world that don't feel like talking about their personal life.
That's where AI could come into place. It could help a child picking up a career that fits their personality, that fits their desire and mainly interest.
There are people who are insecure to talk about their own personal life to any human being so here they'll be chatting to a AI Deep learning bot which would potentially live up to that child's mark, which would help him select the right career

II. PROBLEM DEFINITION

The problem definition for an AI-based career counseling system is to provide personalized career guidance and advice to individuals based on their unique interests, skills, and preferences. The system should be able to provide accurate, relevant, and The system can help users stay up-to-date with the latest trends in the job market, including new jobs and emerging industries. It can provide insights on the skills and qualifications required for these jobs and offer guidance on how to stay competitive in the changing job market. up-to-date information to help users make informed decisions about their career paths.

The system can assist students in planning their educational journey by providing information on different courses and programs that align with their career goals. It can also provide advice on the best educational paths and the skills required for success in the job market.

The system can assess the user's current skills and identify areas for improvement. It can provide feedback and suggestions for developing new skills and improving existing ones.

III. LITERATURE SURVEY

A literature survey on AI-based career counseling systems can help in identifying the existing research and developments in the field.
"AI-based Career Guidance System Using Career Path Recommendation" by Park et al. (2020): This paper presents an AI-based career guidance system that provides personalized career path recommendations to users. The system uses a machine learning algorithm to analyze the user's personality, interests, and skills, and recommends the best career paths based on the analysis.
"A Smart Career Counselling System Using Fuzzy Logic and Artificial Intelligence" by Kaur et al. (2018): This paper presents a smart career counseling system that uses fuzzy logic and artificial intelligence to provide career guidance to students. The system assesses the user's personality traits and interests, and provides customized career recommendations based on the analysis.
"A Personalized Career Guidance System Based on User's Personality Traits" by Chen et al. (2021): This paper presents a personalized career guidance system that uses the user's personality traits to provide career recommendations. The system uses a deep learning algorithm to analyze the user's social media activity and provide career recommendations based on the analysis.
"Machine Learning-Based Career Counselling System" by Panda et al. (2020): This paper presents a machine learning-based career counseling system that uses a decision tree algorithm to provide career guidance to students. The system analyzes the user's interests, skills, and academic performance, and provides customized career recommendations based on the analysis. "A Semantic Web-Based Career Counseling System Using Ontology" by Velmurugan et al. (2018): This paper presents a semantic web-based career counseling system that uses ontology to provide career guidance to students. The system uses a rule-

based approach to analyze the user's interests, skills, and personality, and provides customized career recommendations based on the analysis.
Overall, the literature survey highlights the use of various AI and machine learning algorithms, fuzzy logic, semantic web, and ontology in the development of AI-based career counseling systems. The survey also highlights the need for personalized and customized career recommendations based on the user's unique interests, skills, and personality.

IV. PROGRAM FLOW

Here is a high-level program flow of an AI-based career counseling chatbot:

a) User Input: The chatbot starts by prompting the user to provide basic information such as their name, age, education level, and work experience. The chatbot can use this information to personalize its responses.

b) Assessment: The chatbot then assesses the user's skills, interests, and career goals using various methods such as self-assessment tests, career quizzes, and surveys. The chatbot may also analyze the user's social media activity or academic transcripts to gain insights into the user's preferences and skills.

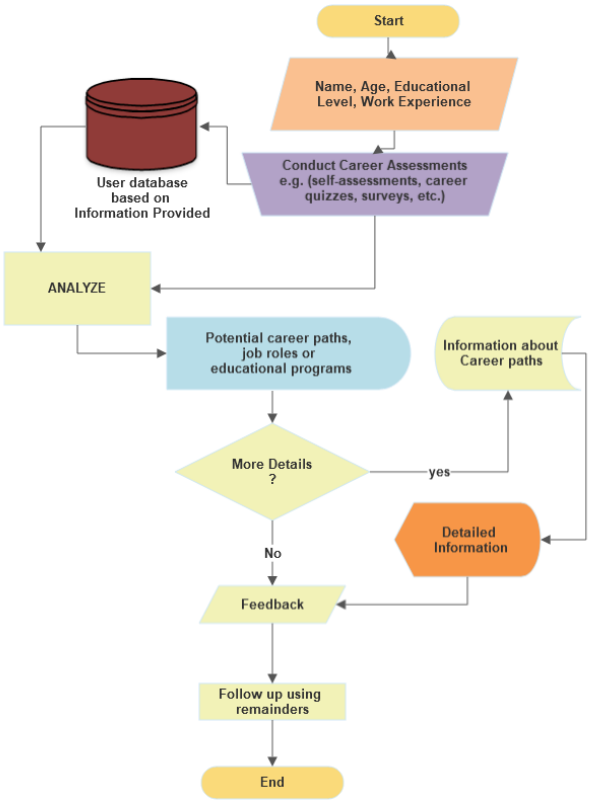
c) Analysis: The chatbot analyzes the information gathered from the user input and assessment to identify potential career paths and job opportunities that match the user's interests and skills.

d) Recommendation: The chatbot then recommends potential career paths, job roles, or educational programs that are a good fit for the user. The chatbot may also provide information about job market trends, salary ranges, and educational requirements for each recommended option.

e) Feedback: The chatbot allows the user to provide feedback on the recommendations, which can help the chatbot refine its analysis and provide more accurate recommendations in the future.

f) Follow-Up: The chatbot may follow up with the user over time to provide additional guidance and support as the user progresses in their career.

g) User Data Management: The chatbot also stores and manages user data, including their input, assessment results, recommendations, and feedback, to improve the accuracy and effectiveness of its recommendations over time.



This program flow is just one example, and the specific implementation of an AI-based career counseling chatbot can vary depending on the features, data sources, and algorithms used.

V. FUTURE SCOPE

The future scope of AI-based career counseling systems is vast and promising. Here are some potential areas where these systems can make a significant impact:

Improved accuracy: With the advancements in AI and machine learning technologies, the accuracy of career recommendations can be further improved. The systems can analyze vast amounts of data from various sources, such as job listings, social media, and career profiles, to provide more personalized and accurate recommendations.

Virtual reality integration: VR technology can be integrated into AI-based career counseling systems to provide immersive experiences for students to explore different careers. Virtual job simulations and interactive job previews can provide students with a more realistic understanding of the day-to-day tasks and requirements of different careers.

Personalization: AI-based career counseling systems can become even more personalized by integrating user feedback and learning from the user's past choices. The systems can also use machine learning to identify new career paths and opportunities that match the user's evolving interests and skills.Integration with education systems: AI-based career counseling systems can be integrated with educational

systems to provide a seamless career guidance experience for students. The systems can analyze the student's academic performance and provide recommendations on educational paths that align with their career goals.

Skill development: AI-based career counseling systems can provide users with recommendations on skill development and training programs that can help them achieve their career goals. The systems can analyze the user's existing skills and identify areas for improvement, then provide personalized suggestions for courses, training programs, and certifications.

Enhanced accessibility: AI-based career counseling systems can be designed to be accessible to a broader audience, including people with disabilities, low-income individuals, and people in remote areas. The systems can use natural language processing and voice interfaces to provide an accessible and intuitive user experience.

Overall, the future scope of AI-based career counseling systems is to provide more accurate, personalized, and accessible career guidance to individuals. As the technology continues to evolve, these systems have the potential to revolutionize the way people make career decisions and find fulfilling careers.

VI. CONCLUSION

In conclusion, an AI-based career counselling chatbot is a promising tool that can help individuals make informed decisions about their career paths. Through the use of natural language processing, machine learning, and other AI technologies, these chatbots can provide personalized career advice and guidance to users, based on their skills, interests, and career goals.

The research on AI-based career counselling chatbots has shown that they can improve the accessibility and effectiveness of career counselling services, particularly for those who may not have access to in-person counselling due to location or cost. Additionally, these chatbots can also help individuals explore a wider range of career options and identify potential career paths that they may not have considered otherwise.

However, there are also some limitations and challenges associated with AI-based career counselling chatbots, such as the need for robust data sets, potential biases in the algorithms, and limitations in the chatbot's ability to understand and respond to complex or emotional issues.

Despite these challenges, the potential benefits of AI-based career counselling chatbots make them a valuable tool for career counselling and guidance. Further research and development in this area can help to improve the accuracy and effectiveness of these chatbots and ensure that they are able to provide personalized, unbiased, and comprehensive career advice to users.

Local Train E-Ticketing System

Mr.Samkit Shah, Shyam Singh,Ms.Neha Yadav, Mr.Ritik Yadav Student) Dr. Rashmi Thakur
Computer Engineering,TCET Mumbai, India

*Abstract:***A platform that enables users to buy train tickets for local train trips is known as a local railway ticket booking system. Passengers no longer need to wait in line at ticket counters thanks to this system's efficient and convenient advance ticket booking option.Passengers can utilise the system's user-friendly interface to look up trains, examine schedules, and purchase tickets online. Additionally, it gives customers access to real-time data on seat assignments and train availability, enabling them to make well-informed travel selections. Additionally, the technology gives passengers the ability to select their favourite seat and travel class.The local train ticket booking system is made to protect the security and privacy of users' financial and personal data. To safeguard user data, it employs stringent security controls like encrypted communications and secure data storage. To ensure that all transactions are performed safely, the system also offers a secure checkout process.**

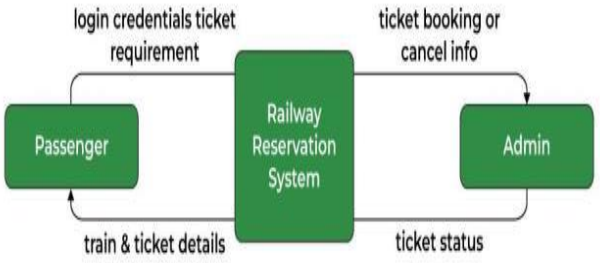
Introduction:

A computerised system that simplifies the booking and purchasing of tickets for local trains is known as a local railway booking system. The main goal of such a system is to give passengers a simple, effective, and simplified way to schedule and reserve their train travel. Users can often search for available trains, see schedules, and choose their preferred trains using the system. The passenger can proceed to book a ticket by entering their personal information and payment details after choosing the train. A special ticket number is then generated by the system and given to the passenger so they can board the train.

In some circumstances, the local train reservation system might additionally offer other services, such the choice of a preferred seat or access to real-time train status data. The system can be accessed via a call centre, a smartphone app, or a web portal.

By lowering wait times and doing away with manual ticketing procedures, the deployment of a local railway booking system may greatly enhance the overall travel experience for customers. In order to make wise judgements about train timetables and routes, it also gives rail operators useful insights into passenger behaviour and demand patterns.

Methodology:



Storing Data:

A local train reservation system's data storage is an essential

component because it is in charge of managing and storing the massive volumes of information the system generates. A local railway reservation system may store the following types of data:

1. Passenger Information: This includes personal information like name, address, phone number, and ID information as well as ticketing details like the kind of ticket bought, the day of travel, and the train number.
2. Train Timetables and Availability: Passengers can view the schedules and available trains when they search for trains to book using this data. Additionally, it aids in managing and monitoring the number of seats that are available on each train.
3. Payment Information: The system keeps track of information about passenger payment transactions, such as the mode of payment, the amount paid, and the transaction's date and time.
4. Ticket Data: The system keeps track of details about the tickets that customers have purchased, such as the ticket number, the date of travel, and the train number.

A database, which may be a relational database or a non-relational database, is normally where the data in a local train ticketing system is kept. The database to choose will depend on the system's unique requirements, including the

amount of data to be stored, how quickly it must be retrieved, and how complicated the links between the data are.

It's crucial to make sure that the information kept in a system for booking local trains is secure and shielded from unauthorised access or modification. Measures like access limits, encryption, and regular data backups can help achieve this.

Payment:

A payment gateway is a crucial part of a local train reservation system that enables customers to pay for tickets in a safe manner. The payment gateway functions as a link between the customer and the bank or financial institution and is integrated with the reservation system.

The payment gateway serves a number of crucial purposes when a consumer makes a payment through the local train booking system, including: Authorization: The payment gateway confirms the Rail operators can also benefit from location tracking because it offers essential information about the operation of their trains, such as the average speed and on-time performance. Train routes and schedules can be improved with this data, and passenger services can be improved as well.

Literature Review :

All customer-related issues will be resolved by making the entire railway ticketing system online. Online credit card booking is available for passengers. Online applications give customers access to a wealth of information about the trains in addition to the ability to book tickets online. Passengers can now inquire about tickets and train information, including their route, originating and destination stations, class, and fee for each class, among other things. Live train schedule at that very moment. One of the simplest and most reliable ways to reserve tickets is online through this website. All that is needed is access to our website via an internet connection and the ability to make payments online using a debit or credit card. On this website, a list of banks is cited. Numerous user-friendly features will be offered. Depending on the inputs users provide on the website's interface, it will react. For instance, the website would calculate the ticket prices depending on first class or second class and single or return journey as per entered by the user if the user enters the source and destination. Because the fare will be automatically withdrawn from the wallet available on the website, the user does not need to carry precise change for ticket prices..Following are some tools:

React:

Due to its simplicity and quickness, React has gained popularity and is now the preferred JavaScript flavour for many programmers. But what precisely is React, and what applications does it serve? This post will examine React and explain how it generates functional user interfaces (UIs).

Due to its extensive library of prewritten code, React facilitates the creation of user interfaces more quickly. This sample code can be used to more effectively create a variety of interactive JavaScript routines. Here are some uses for React, for example:

1. 1. enabling users to view and interact with photos.
2. 2. Control the placement of text on a page.
3. 3. Create entry fields for web applications.
4. 4. Create charts automatically.

Mysql Database:

Mumbai's local trains carry a big number of people every day, hence a sizable database is needed to manage all the information pertaining to this enormous number of consumers. A systematic collection of data is called a database. Database management systems, whether used as stand-alone programmes or as a component of other applications, are essential to computing because computers are excellent at processing vast volumes of data. Instead of placing all the data in one huge warehouse, a relational database retains the information in separate tables.

The MySQL Database Software is a client/server system that includes a multi-threaded SQL server that supports several client programmes and libraries, administration tools, and a broad variety of application programming interfaces (APIs). As a result, we may manage a big number of users and carry out a variety of tasks utilising a single database by using MySQL Database Software.

The following are some more tools that will be used in the website's development:

Visual Code.

2. CSS framework

Sass. 3.mongodb.

Tools for SEO (optimize search queries).

5. GoDaddy, which hosts domains

RESULT & DISCUSSION:

Security, flexibility, cost, and convenience are just a few benefits that an e-ticket can provide for both passengers and airlines. In addition, it offers the usual

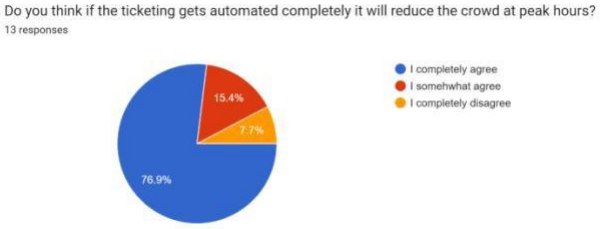
1. accuracy of the payment information provided and that the customer has enough money to execute the transaction.

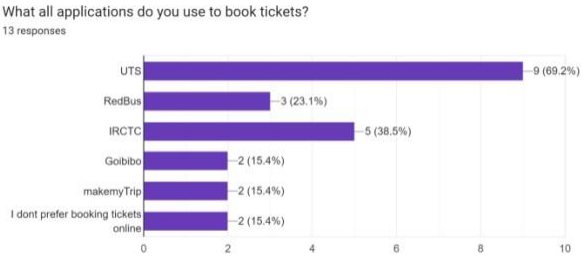
2. Encryption: To prevent unwanted access, the payment gateway encrypts sensitive data, including credit card numbers and other personal information.

3. Processing: To finalise the payment, the payment gateway processes the transaction and contacts the customer's bank or financial institution.

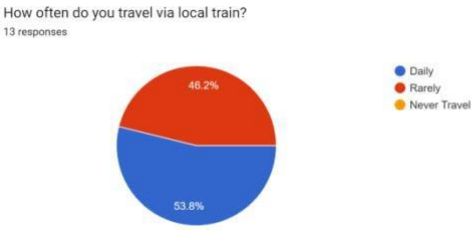
Settlement: The payment gateway completes the transaction and sends the money to the rail company. Online payment processing, mobile payments, and recurring guarantees found on a typical paper ticket, including flexibility in seating and travel times.

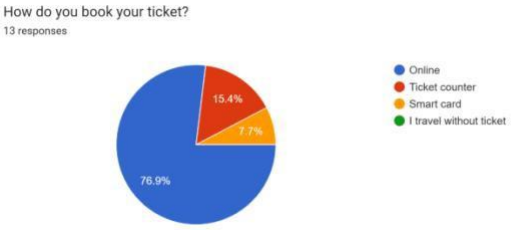
E-tickets cannot be "lost" because they are stored in a computer database network, unlike the passenger who forgets his ticket at the ticket counter. They are therefore difficult to steal as well. The majority of the time, travellers print out copies of their e-tickets, confirmation emails, itineraries, and other related papers. All of those documents can be changed by taking them out of the computer once more, and the e- ticket can only be used by someone who has the required identification. The cost of printing new tickets for customers who misplaced or forgot their old paper tickets could apply. Passengers in some circumstances had to purchase brand-new tickets at full price. In this regard, electronic tickets have a definite benefit.





Responses:





Future Scope:

A local train reservation system's potential is influenced by a number of variables, including the market's size, the pace of technological advancement, and the intensity of rivalry. However, there may be need for development and improvement in the following areas: Integration with other technologies and mobile devices to enhance user convenience and ticket booking efficiency.

putting in place a cashless payment system will make buying tickets easier and need fewer physical exchanges.

expansion of services to include other forms of transportation, such buses and taxis, to give commuters a more complete answer.

Provide accurate and current information regarding train schedules and delays by integrating real-time tracking and updates.

Personalization of services and offers to meet the tastes and requirements of each unique user.

4. the use of artificial intelligence and data analytics to improve service delivery, pricing, and train schedulingpayments are just a few of the many services that payment gateway providers provide. Rail operators can select a payment gateway that best meets their needs and synchronises with their regional train reservation system.

A successful local train reservation system must include

a safe and trustworthy payment gateway since it allows users to execute transactions with trust and confidence.

Location Tracking:

Location tracking in a local train reservation system refers to the system's capacity to track trains' current whereabouts and A local train reservation system has a bright future and has a lot of room to grow and improve as technology develops and consumer preferences change.

Conclusion:

In conclusion, a system for reserving local trains is crucial for overseeing and improving the performance of local trains. This solution offers a practical and effective substitute to conventional booking procedures by enabling users to quickly order tickets online.

Typical features of the system include real-time train availability and schedules, passenger data management, payment gateways, and position tracking. A local railway reservation system that incorporates these elements can assist in streamlining the reservation process, increasing the accuracy of ticket sales, and giving passengers a more pleasant and enjoyable travel experience.

Additionally, mobile-friendly local railway booking systems have grown in popularity as a result of the increased use of smartphones and other mobile devices, as they enable customers to make reservations while on the go. By automating many of the manual procedures associated with ticket sales and management, this technology can aid rail operators in lowering costs and improving efficiency in addition to convenience.

A well-designed local train booking system can give rail operators a substantial competitive advantage in today's fast-paced world by assisting with customer acquisition and retention, revenue growth, and general customer happiness.

5. https://www.academia.edu/36068483/Onlin e_Railway_Ticket_Booking_System https://www.academia.edu/40665717/ONLI notify passengers. This feature can be especially helpful for passengers taking a local train because it enables them to monitor the train's movement and determine when to anticipate their arrival at their destination.

A local railway reservation system can incorporate location monitoring in a number of methods, including:

2. GPS tracking: Trains may be fitted with GPS tracking equipment that sends real-time location data to the system. The location of the train can then be accurately and timely communicated to passengers using this data.
3. Cell Tower Triangulation: By combining the signals from various cell towers, the system may use the mobile network to pinpoint the train's location.
4. Wi-Fi tracking: The technology can locate the train by using Wi-Fi signals from neighbouring Wi-Fi hotspots.

Passengers can view the location tracking data via the local train reservation system's web page or mobile app. Real-time updates of this data enable passengers to monitor the train's movement and determine the approximate time of arrival at their destination.

Development & Implementation Of An Integrated Web-Based Office Document Management System

Rohan Yadav, Shubham Yadav, Siddakdeep RajkumarThakur College of Engineering & Technology
Under The Guidance of Ms. Lydia Suganya

*Abstract:***The aim of the project is to develop a document management system that is able to deliver access to anyone authorized anytime, anyplace on any device. The system developed makes use of rich internet technology to replace desktop application with rich internet application. The system shares the advantage of both web application and desktop application, and removes the most disadvantages At the end of the project, a web based document management system is developed. The built-in document type supports are Microsoft Word, PDF, and Postscript. This system enable user to manage document within the web browser and without any support installed.**

Introduction

Document Management and Tracking System focuses primarily on the storage, retrieval and document sharing of self-contained data resources in the document form.

Specifically, the objectives are:

1. To provide an integrated system that will store and allow viewing of documents.
2. To track document status that can be categorized into urgent, priority and regular.
3. To create the sharing of documents.
4. To generate printable documents such as:

One of the biggest effects that modern technology has on business operations revolves around document automation. It is increasingly used within certain industries to assemble legal documents, contracts and letters.

The purpose of the system is to provide a better working system.The study aims to develop a Web-based Document Management and Tracking System that will reduce the physical handling of documents inside the organization. In most basic sense, the featured system is designed to handle the document management process, from acquiring data, gathering information needed to the approval and distribution of the document. Documents are routed through different departments.

For the Administrative staff, he is capable of creating status list, add new tag names, add employee, and add new department. They do not have to print bunch of paper documents just to distribute to their secretaries. The first document will be coming from the admin department, which will be distributed by the secretary, and to the employees who are involved. Also they can add a particular user by department.

For the secretaries, they can easily distribute and track the documents from the admin department.

For the users or the employees, they do not have to waste so much time searching for documents in a cabinet or drawer. In addition, they can be easily notified whenever they receive new documents.

A Web-based Document Management System revolves around a centralized repository that is used to manage the storage of any type of information that could be value to an organization, and protect the same against loss. As content stored within a DMS is typically self-contained, a well-designed document management system promotes finding and sharing of information. Each phase of the process is performed by a person in a specific role with distinct access to and responsibility for a document. It is important to understand these roles and what each can do in the system. The system adopts the document process and document management workflow of the previous system, the current system is related to the developed system in terms of operations like creation, editing and viewing of documents. Also, it has a similarity when it comes to distinct person who is accessing the documents.

A Web Article Document Management System (2011), explained that the fundamental point of document sharing is that the document carries information in a format so that it could be shared, disseminated, stored and acted upon. The current situation in the construction industry is that a mixture of different generation methods is used for managing documents. Hardly any documents are today produced by hand, but a lot are still transferred by printing them out and sending them to the other parties by mail or couriers.

In the same article, it explained why traditional method of Document Management is a failure. Traditional method of document management is known as passive management of files where documents reside when the user has finished with them. Most users pass by or ignore the organization rules about filing documents with the records center file rooms. Once users have obtained the documents important to their activity, they tend to hoard the information. At most, they will wrap up all the record associated with a project at the conclusion of the activity. There is no value added in request, receipt, and disposition systems for documents in file folders that are not accessible or retrievable.

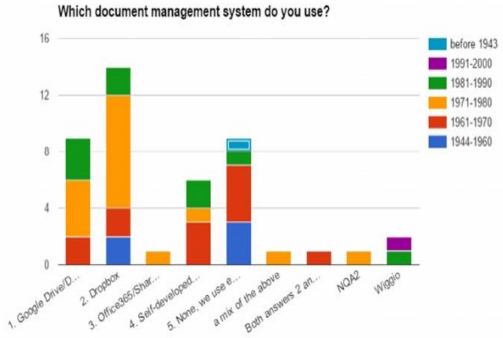
Moreover, traditional method of document management is paper-based, with the consequent non-traceability, possible loss, information fragmentation and not accessibility of the information.

.

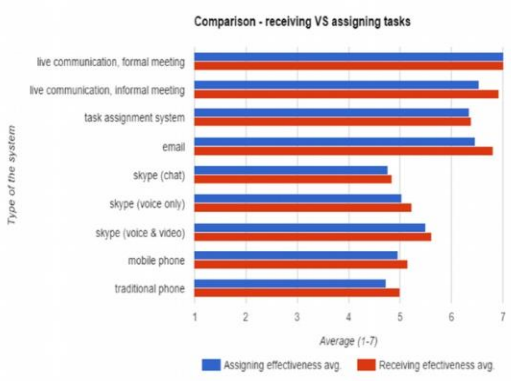
The document management module is divided into three modules: storing, indexing and search and retrieval. The storing handles the storage of approved proposal documents, thesis documents, teaser videos, request forms, and other documents uploaded in the digital repository. The indexing handles the encoding of information about the document. It also includes tagging that would be used for easier searching. The search and retrieval module allows the users of the system to search for the thesis documents in different ways and view it.

The system supports the use of tag and search. Moreover, it also adopts the document management module that is divided into three, which is storing, indexing, and search and retrieval from the previous system.

Literature Survey



The above survey indicates that currently Google Drive is the most used document management system used by companies followed by DropBox



- In this literature survey, we review some of the existing research on web-based document management systems to identify the key features and benefits of these systems.
- Benefits of a web-based document management system ,a web-based document management system offers several benefits to organizations, including improved collaboration, increased efficiency, and reduced costs.
- Features of a web-based document management system Web-based document management systems typically include several key features, such as document storage, version control, document search, document sharing, and user access control.
- According to research conducted by Guo et al. (2019), these features are critical for the effective management of digital documents.
- While the benefits of a web-based document management system are clear, there are also some challenges that organizations may face when implementing these systems. Research conducted by Kuo et al. (2015) identified several challenges, including user resistance, lack of IT support, and the need for extensive customization.

DESIGN AND METHODOLOGY

Functional Requirements:

This phase contains the functional requirements for the Document Management and Tracking System collected from the users, which have been categorized to support the types of user interactions that the system must have. The developers considered the required needs given by the client.A sequence of functions of the developed system are described as follows:

1. **Account**
   1.1 All the users of the system shall have an account to login.
2. **Login**
   2.1 The user shall enter a valid username to access the system.
   2.2 The user shall enter a valid password.
   2.3 The users shall be able to view their profile information after logging in to the system.
3. **Upload Profile Picture**
   3.1 The admin head shall be able to upload/change photo of the employees.
4. **Announcement**
   4.1 The admin head shall be able to add, delete, and update announcements.
5. **View Documents**
   5.1 The users shall be able to view the documents related to their departments.
6. **Manage Account**
   6.1 The admin head shall be able to manage or add, edit, delete, and update the employee's information.
7. **View Employees Department**
   7.1 The admin head shall be able to view a specific department and the employees.
8. **Create Document**
   8.1 The admin head and secretary shall be able to create a document.
   8.2 The admin head and secretary shall be able to add documents from a particular source.
   8.3 The admin head and secretary shall be able to send documents to a particular user.
9. **Create Tag Names**
   9.1 The admin head shall be able to add/remove tag names in a document.
10. **Create New Status List**
    10.1 The admin head shall be able to create new status list. If in case a document's status on process needs to be changed into urgent from being a regular document, he/she can change it.
11. **Distribute Documents**
    11.1 Admin head
        11.1.1 The admin head shall be able to distribute documents to his/her secretary.
    11.2 Secretary
        11.2.1 The secretary shall be able to distribute documents to the employees
12. **Track/Monitor Documents**
    12.1 The admin head and secretary shall be able to track/monitor the distributed document within the organization.
13. **Forward/Received Documents**
    13.1 The users shall be able to view the forwarded/received documents.
14. **Download Documents**
    14.1 The users shall be able to download particular documents they needed if necessary
15. **Change Password**
    15.1 The admin head shall be able to change the user's password if forgotten.
16. **Logout**
    16.1The admin head and user shall be able to logout when they are done using the system.

Testing Phase

This the phase in the agile methodology that discusses the different testing
techniques used by the developers to assure the quality and completeness of the system.

Testing

To validate the system, the developers will gather feedbacks on the user to gather information on how the system worked. It will ensure if the system is user friendly, if functions are working properly, and if the system fulfilled the objectives of the study.

Conclusion

Based on the findings, the following conclusions are hereby presented:

1. Providing an integrated system that store and allow viewing of documents.
2. Track necessary document throughout the process.
3. Sharing of documents between the users.
4. Generating printable documents such as Accounting Reports, Licensing Reports, Operation Reports, Admin Reports, Engineering Reports, Technical Services Reports.

For furtherance, the developers recommend the following:

1. To add feature such as the e-signature which can provide easier and faster way of signing the documents without printing the documents needed to be signed.
2. To make the system online for the employees to access the system even if they are not at work and needed documents immediately.
3. To add more types of documents in the system in order to provide a system which is capable of sharing and tracking more documents in just one system.

Abstract:

Nowadays virtual assistant is playing a very important role in our daily activities and has become an inseparable part of our lives. As per the Clutch survey report that was published in 2019, almost 27% of people are using AI virtual assistants for performing their day-to-day activities. AI is an emerging field that we aim to explore through this project of AI-based workout assistants. In our work, we introduce Fitness Fire, an application that detects the users exercise pose counts the specified exercise repetitions and provides personalized, detailed recommendations on how the user can improve their form. The application uses the MediaPipe[4] to detect a persons pose, and afterwards analyses the geometry of the pose from the dataset and real-time video and counts the repetitions of the particular exercise.

*Keywords**: AI, Virtual assistant, CNN, workout assistant, Pose estimation. Blazepose, OpenCV.***

I. Introduction

In our work, we introduce Fitness Fire, an operation that detects the druggies exercise disguise counts the specified exercise reiterations and provides substantiated, detailed analysis about perfecting the druggies body posture. This is an AI- grounded Workout Assistant and Fitness companion to guide people who do not have access to the gym but are still willing to work out at home to maintain their constitution and fitness and keep their body in good shape. To help them perform the exercises rightly and help them from chronicle and immediate injuries. This also provides a personalised health companion and diet plan along with a personalised diurnal drill calorie count. The operation also displays necessary health insurances and programs handed by the government of India for the common people and check the eligibility criteria using API and Web services. Staying at home for long ages of time can come boring, especially when most delightful conditioning are done outside, which is delicate considering the current script of afflictions and lockdown. But this can not be a applicable reason for being unproductive because it's an excellent idea to use the redundant time we get into our own health. utmost gymnasiums have a wide variety of exercise outfit and also have coaches who guide us about the exercise and its correct posture. But the attainability of the below outfit and coaches can be an important reason that can stop us from doing exercise at home. We aim to make an AI-grounded coach that would help you exercise more efficiently in your own homes. The design focuses on creating an AI algorithm to help you exercise, by determining the quality and volume of reiterations

which is done by using disguise estimation running on the CPU. This design, which will have a nondistractive interface, intends to make exercising further easy and further fun. We're going to see an overview of the donation of these families, their algorithms, advantages, disadvantages, its effectiveness compared to other being technologies, operations and possible unborn work.

II. Literature Review

According to a survey by Rakuten Insight[2] on gym membership in India in August 2020, around 67 percent of the participants did not have a gym membership. Only one-third of the total respondents claimed to be members of a gym. This is mostly because most people don't have time or due to the cost of membership. In this scenario, online app can play an important role. Anyone can download the app on any device, including tablets, laptops, or smartphones. This makes it so much easier for people to maintain their physical health. A fitness app can promote individual health and wellness and help strengthen communities by promoting an active lifestyle that invites all members. There are numerous applications available in the market which guide the user about the exercises to be performed. But through our application, we not only guide the user regarding which exercise to perform but also about the correct posture and counting the repetitions using computer vision. This application can be considered as the workout assistant which provides real-time posture detection and diet recommendations. The application can not only be used by individuals at homes but by increasing the scope can be used in gyms as smart trainers thus reducing the human intervention.

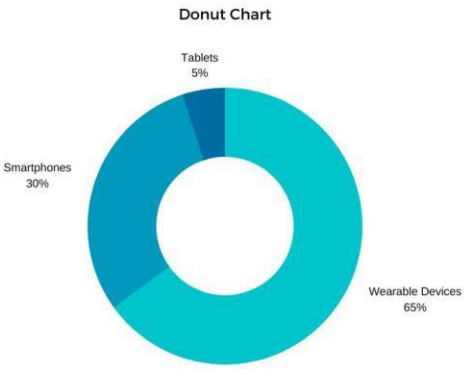
[1] In a research, it was only recommending the yoga and not any particular exercises. While making a public app, we need to ensure that every person's expectations are met, if not every then at least maximum. So it is important to make sure that the people who are not very comfortable with yoga can also use the app by including exercises from basic to advance.

[6] In one of the paper, they are focusing on recognizing the image using a Pose Recognition Unit, where they are training the system to recognize the pose and its accuracy. They are basically using a formula to get the angle between the body segments. And then they calculate the angle between the segments. This in turn slow down the operation as it takes huge time for calculations. They are also mainly targeting the exercises including wall-sits and planks.

[3] In another paper, the researchers came up with the solution of one of the drawbacks that is overcoming the problem of detecting multiple people in a single time frame. The OpenPose[5], they are using here needs high computing power.

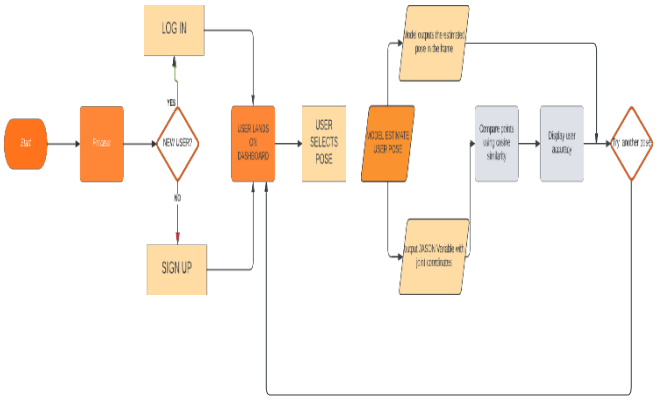
III. Proposed Methodology

We have conducted various survey to come to know what most people are looking for in an online form for their fitness.



From the survey we came to know people mostly like wearable devices and then comes the mobile phones. So we came up with the solution of creating an app which can be installed in both smart watches as well as smart phones. So, we are creating an app that can be used as a personal trainer. The person enters his/her body measures and various details regarding their fitness and in turn the app will recommend them the best exercise they can perform for a healthy body and lifestyle.

A. Flowchart



As seen in the figure above, once the app recommend an exercise to perform it will check the accuracy of the performed exercise and then once it is correct it will go on to the next one.

B. Software/Hardware Requirements

Software Requirements are:

a. Python
b. Java
c. MediaPipe
d. Android Studio

Hardware Requirements are:

a. Webcam
b. Windows 10

C. Prototype

IV. Future Scope

The current app will recommend you the exercise according to your details entered. It does not store the exercises already completed. Thus in future, we can add this feature and also enable a prediction system which can predict what will be after performing the given exercise after a particular day; say for example, lose weight, increase in muscles, toned body, etc. We can also include the feature of including multiple people in a single frame which was not possible now as we were concerned about time complexity. We can also recommend diet plans in addition to exercises. The number of exercises can be increased which were limited now. We can also recommend the exact time slot for eating and exercising.

V. Conclusion

To conclude, an app was created for people who can't afford gyms or don't have enough time to go to and fro so that they can take care of your health by exercising at their homes itself. We use the video of the person performing a particular exercise and see the accuracy of their pose and one's it is correct they can move on to the next exercise. It will also recommend them on which exercise to perform on what day. This will help them to take care of their physical fitness.

VI. Acknowledgement

We would especially like to thank Dr. Manish Rana, the research head and our guide, for his contributions towards the growth of the paper. Additionally, we would like to thank our principal, Dr. B.K. Mishra, for motivating us to present our concept as a research article.

adityayadav1088@gmail.com, yadavdhiraj641@gmail.com, yadavprince2304@gmail.com, princeyadav1692@gmail.com

Abstract: **This paper aims to address the challenge of managing multiple compilers on a single machine to compile programs in various languages concurrently. The main focus is on resolving the issues of compiler storage and portability, enabling users to submit their programs without the need to install any compilers. The proposed solution involves a controller that determines which compiler server should handle each program, based on the backend compiler's workload. The compiler server then compiles and executes the program, and the output is sent back to the user. The paper also evaluates the controller's load distribution effectiveness by measuring the overall response time of programs in both serial and parallel program allocation to the compilation tier. The results demonstrate the feasibility and effectiveness of the proposed approach in managing multiple compilers efficiently.**

Keywords -- ***Online Compiler, Cloud Computing, Load Balancing, Multithreaded Programming***

I. INTRODUCTION

Cloud Computing is computing that involves a large number of computers connected through a communication network such as the internet, similar to utility computing. [1] The International Telecommunication Union (ITU) defines 'cloud service' as 'a service that is delivered and consumed on demand at any time, through any access network, using any connected devices using cloud computing technologies.' Cloud Service is further classified into Cloud Software as a Service (SaaS), Communications as a Service (CaaS), Cloud Platform as a Service (PaaS), Cloud infrastructure as a service (IaaS) and Network as a service (NaaS). In this paper, we propose Online Compiler as a Software as a Service (SaaS). A compiler transforms source code from a higher level language to a lower, machine level language. This is mainly done in order to create executable files which can then be run in order to execute the program and its instructions. [2] Section II shows the Compiler Architecture. In Section III, the algorithm is explained through pseudo code. Finally, the conclusion is drawn in Section IV.

II. COMPILER SYSTEM ARCHITECTURE

The online compiler service allows users to compile programs written in C, C++, or Java without requiring the installation of any compilers on their local systems. To submit their program, the user can simply type the code into the provided code editor in the user interface. Once the compilation is complete, the user will receive the output. If the compilation is unsuccessful, the errors will be displayed and the testcases for which the program failed will be provided as well, but if it is successful, the output will be provided. The online compiler's architecture is structured into three distinct tiers: the User Interface Tier, the Controller Tier, and the Compilation Tier.

A. ***User Interface Tier:***

The User Interface Tier is a critical component of the online compiler system. This tier is responsible for providing the user interface and the database used to store user data. The database used in this tier is implemented using MongoDB Atlas Server, ensuring reliable and efficient storage and retrieval of user data.

The user interface is a web application that is hosted on the IIS Server. The web application provides the user with an interface to submit their programs quickly and easily. Users can submit their programs by typing the code into the text area provided or by uploading the code as a file with the required extension (.c for C, .cpp for C++, and java for Java programs).

The system supports two types of users: Guest Users and Registered Users. Guest Users are users who do not register with the system but can still write their programs using any mechanism and receive their output after a certain amount of time. On the other hand, Registered Users are those who register with the system and have access to additional features.

Registered Users are provided with the ability to view their program history, which allows them to keep track of their past activity in the system. They can also view the details of every program they have submitted, including codes and outputs, as well as the compile and run status.

Moreover, Registered Users have a longer program execution time than Guest Users, allowing the system to wait for an extended period to obtain the output. This feature is useful for users with complex programs that require more time to execute.

B. ***Controller Tier***

The Controller Tier is responsible for managing the interaction between the User Interface Tier and the Compilation Tier. At the center of this tier lies the Compiler Control Centre, which comprises three parts. The first part is **Compiler Server Management**, which allows the addition of new compiler servers, displays the status of the existing servers, and removes them if needed. This part also ensures the servers are running and active by pinging them at fixed intervals. If a server fails to respond, it is marked as faulty to prevent future program assignments, and existing programs are re-routed to other active servers.

Scheduler Management: This part of the system retrieves uncompiled programs from the database and sends the program data packet to the compilation tier servers.

Program Output Management: Here, the "receive output server" receives the compiled program packets from the compilation tier servers and stores them in the database. The lIS server in the User Interface Tier retrieves the output from the database and sends it to the web-client.

Figure 1 illustrates the interface of the Compiler Control Centre.

Figure 1 – Compiler Control Centre

*C. **Compilation Tier***

The compilation tier includes a set of "n" compiler servers that are responsible for compiling and executing programs. Before accepting a program, each compiler server checks its CPU usage and available RAM to ensure that they meet a pre- defined threshold value. Programs that do not meet these requirements are rejected. After successful compilation and execution of a program, the resulting output is sent to an Output Server located in the Controller Tier. A visual representation of the entire compiler architecture can be seen in Figure 2.

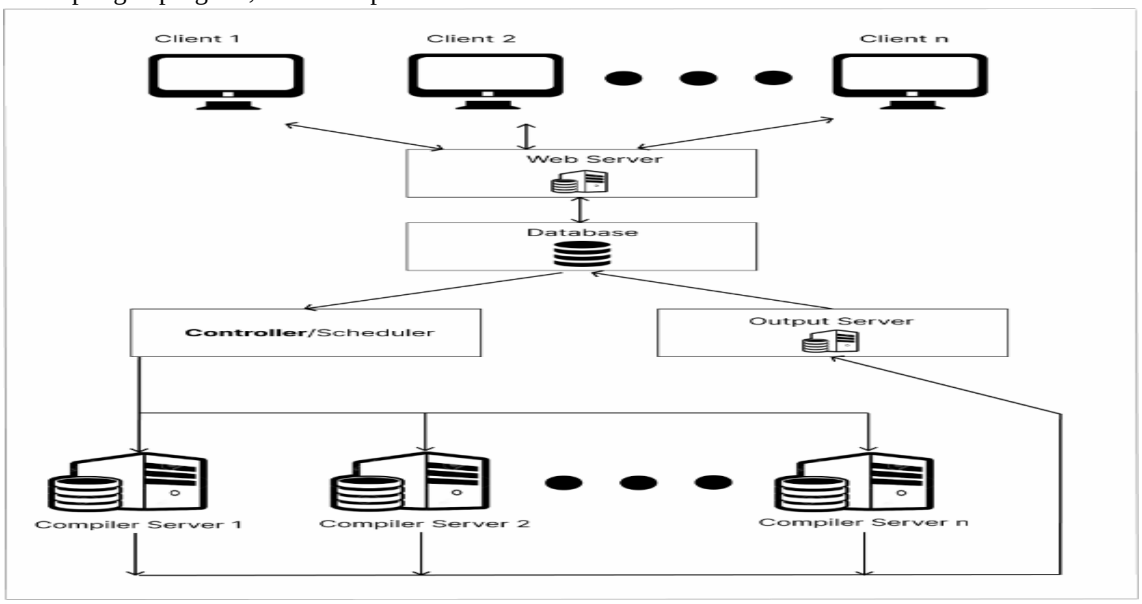

Figure 2: Online Compiler Architecture

III. ALGORITHM

Explanation:
The algorithm employed is a multithreaded approach, where two threads are initially started, the **startProgramMonitor** and **receiveOutput(program)**. The startProgramMonitor thread is responsible for retrieving the list of all programs from the database and examining them against certain conditions to determine if a program requires allocation to a backend compiler server for compilation. Two cases where a program requires allocation are identified:
(1) a program that has not yet been allocated to a backend compiler server, and
(2) a program that has been allocated to a backend compiler server but has not generated any output within a predetermined period, indicating that the allocated server is either unreachable or out of order, hence the program needs to be reallocated to another backend compiler server.

If the current number of threads is within the THREAD LIMIT (limit), the allocateServer(program) thread is initiated to allocate the program to a backend server. However, if the thread limit has already been reached, the algorithm will wait until the number of threads falls below the specified limit. In the allocateServer(program) thread, the list of currently running backend compiler servers is obtained from the database and sorted in ascending order of priority, with any suitable sorting algorithm. The thread then attempts to send the program to the compiler server with the lowest priority. If the server accepts the program, the priority of that server is increased by one. If the server is overloaded and declines the program, the priority for that server is increased by two, and the thread attempts to allocate the program to the compiler server with the next highest priority. The priority of the compiler servers is increased when a program is allocated to them, so that during the iteration for the next program, the compiler server chosen previously will have higher priority, and the thread will allocate to a less overloaded server with a lower priority.

Finally, the receiveOutput(program) thread updates the output of a pre-allocated program in the database and reduces the priority of the backend compiler server that generated the output, as its pending jobs are decreased. Therefore, the particular compiler server will have a better rank in the priority list when the next program is processed for allocation.

IV. CONCLUSION

This paper presents a cloud model that is well-suited for use in scenarios that require the quick compilation of programs and viewing of output by a large number of users. A prime example of such a scenario is online coding contests where contestants need to submit their programs for evaluation by a central server. By adjusting the number of backend compiler servers in the system to match the expected number of users, significant performance improvements can be achieved, as shown in Section III and Figure 3. Overall, this cloud model has the potential to enhance the efficiency and effectiveness
of online coding contests and other similar applications.

Abstract— **Emergency ambulance services play a critical role in saving lives in medical emergencies. However, response times can be slow due to a number of factors, including traffic congestion, limited resources, and communication challenges. This research aims to address these issues by developing an emergency ambulance service app that improves response times and enhances communication between ambulance services and medical facilities. The app will use real-time GPS data to track the location of ambulances and medical facilities, and provide real-time updates on the status of emergency cases. The app will also use machine learning algorithms to optimize the allocation of ambulances to emergency cases based on factors such as location, severity of the case, and the availability of resources. The results of this study demonstrate the potential of the app to significantly improve response times and enhance communication in the emergency ambulance services sector.**

Keywords— Optimization, Allocation, Location, Severity, Availability, Improvement, Communication enhancement. Emergency ambulance service app, GPS, Real-time updates, Machine learning algorithms

I. INTRODUCTION

In medical emergencies, every second counts. The prompt and efficient delivery of medical care is critical to saving lives and reducing the severity of medical conditions. However, emergency ambulance services often face challenges in achieving fast response times, particularly in urban areas with heavy traffic congestion and limited resources. Additionally, communication between ambulance services and medical facilities can be a major bottleneck, leading to delays and inefficiencies in the provision of medical care.To address these challenges, this research focuses on the development of an emergency ambulance service app. The app will leverage real-time GPS data and machine learning algorithms to optimize the allocation of ambulances to emergency cases and provide real-time updates on the status of cases. By improving the efficiency and communication of emergency ambulance services, the app has the potential to significantly reduce response times and enhance the delivery of medical care in medical emergencies.

The findings of this study have important implications for the emergency ambulance services sector and will contribute to the ongoing efforts to improve the delivery of medical care in medical emergencies.

II. LITERATURE REVIEW

Emergency Medical Services (EMS) play a vital role in providing timely and efficient pre-hospital care to patients in need of medical assistance. The World Health Organization (WHO) [1] defines ambulance services as the process of transporting patients from the scene of an emergency to a healthcare facility. EMS providers are responsible for providing medical care during transport and delivering patients to the appropriate level of care based on their medical needs. EMS systems are designed to improve patient outcomes, reduce mortality rates, and prevent long-term disability. To achieve these goals, EMS providers rely on a range of technologies, including dispatch systems, mobile applications, and location-based platforms.

One recent study by Lee et al. [3] explored the development of an emergency medical dispatch system based on a real-time location information platform. The study found that this technology was effective in reducing emergency response times and improving patient outcomes. Another study by Zhang et al. [4] evaluated a mobile application for emergency medical

services and found that it improved communication between EMS providers and patients, resulting in faster response times and improved care.

Chen and Lee [5] conducted a study on the design and implementation of a real-time emergency dispatch system. The results of the study demonstrated that such a system could reduce response times and improve patient outcomes. In a similar vein, Doshi and Singla [6] examined the use of GIS and GPS technology for emergency medical services in India. The study found that this technology could significantly improve the efficiency and effectiveness of emergency medical services in the country.

Kim and Lee [7] focused on the development of a smart emergency dispatch system based on cloud computing. This technology was found to be highly effective in reducing response times and improving patient outcomes. Li and Li [8] conducted an analysis of the factors affecting emergency medical services performance. The study found that factors such as staffing levels, equipment availability, and infrastructure were critical in determining the success of EMS systems.

Finally, Zhang and Li [9] conducted a study on the implementation of a wireless emergency medical services system. This technology was found to be effective in reducing response times and improving patient outcomes. Lee and Kim [10] analyzed the factors influencing emergency medical services response times and found that factors such as traffic congestion, weather conditions, and population density were critical in determining response times.

Overall, the literature suggests that EMS providers rely on a range of technologies to provide timely and efficient care to patients in need of medical assistance. Dispatch systems, mobile applications, location-based platforms, GIS and GPS technology, cloud computing, and wireless technology all play critical roles in improving response times and patient outcomes. Factors such as staffing levels, equipment availability, and infrastructure are also essential in determining the success of EMS systems. Understanding and addressing these factors is critical in improving the quality of emergency medical services and ensuring better patient outcom

I. METHODOLOGY

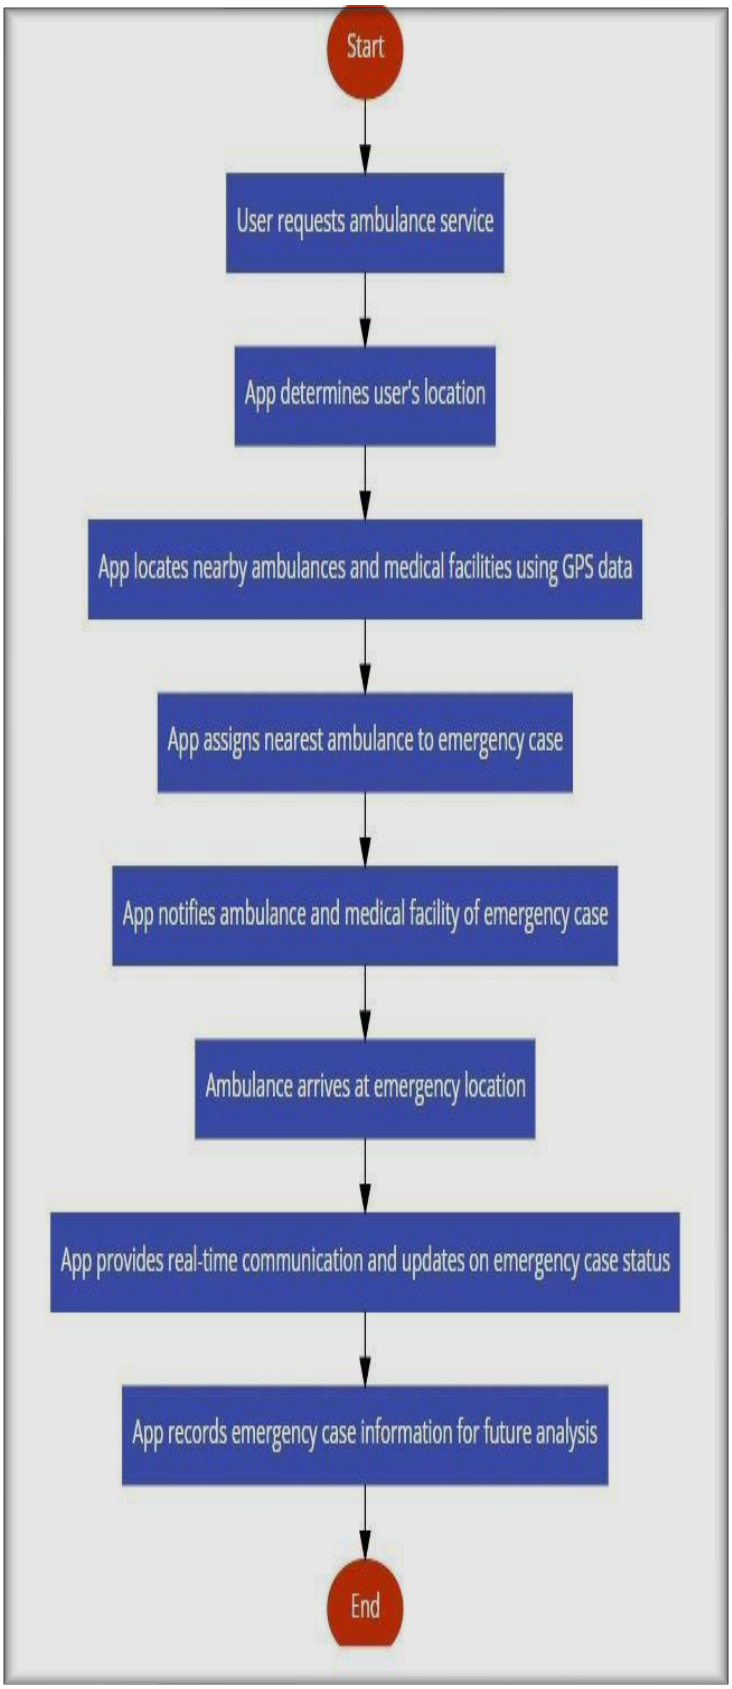
This study will use a mixed-methods research design to develop and evaluate an emergency ambulance service application. The methodology will involve the following steps:

Needs Assessment: The first step in the research methodology will be to conduct a needs assessment to identify the requirements and challenges of the current emergencyambulance service system. The needs assessment will be conducted through interviews with emergency medical service providers, medical professionals, and patients, and through a review of existing literature and policies related to emergencymedical services.

Development of the application: The second step in the methodology will be to develop the emergency ambulance service application. The application will be developed using open-source software and will be designed to provide real-time tracking of ambulance locations, communication between ambulance services and medical facilities, and optimization of ambulance allocation to emergency cases using machine learning algorithms. The development process will involve agile development principles and continuous testing and refinement.

Evaluation: The third step in the methodology will be to evaluate the effectiveness of the emergency ambulance service application. The evaluation will involve a mixed-methods approach that includes both qualitative and quantitative data collection. Qualitative data will be collected through interviews and focus groups with emergency medical service providers, medical professionals, and patients. Quantitative data will be collected through real-time tracking data of ambulance locations and response times, and through survey data from emergency medical service providers, medical professionals, and patients. The data collected will be analyzed using descriptive statistics and thematic analysis.

. Limitations will be addressed through transparency in the methodology, continuous testing and refinement of the application, and careful data analysis and interpretation. The emergency ambulance service app consists of three main components: theapp interface, the machine learning algorithms, and the communication platform. The app interface is used by ambulance services and medical facilities to access the app andreceive real-time updates on the status of emergency cases. The machine learning algorithms optimize the allocation of ambulances to emergency cases, us



The system model, labeled as Figure 1 in the paper, describes the process of how an ambulance service is requested and carried out through a mobile application. The process begins when a user requests ambulance service through the app. This triggers the app to determine the user's location using GPS data, which is used to locate nearby ambulances and available medical facilities using real-time GPS data.

Once the nearest ambulance has been assigned to the emergency case, the app notifies both the ambulance service and the medical facility of the emergency. This allows both the ambulance service and medical facility to prepare and coordinate efforts, ensuring that emergency response is both timely and efficient.

Once the ambulance arrives at the emergency location, the app provides real-time communication between the ambulance service, medical facility, and the emergency responders. This communication ensures that all parties involved in the emergency are aware of the situation and can take appropriate action. Additionally, the app provides real-time updates on the status of the emergency case, keeping everyone informed of any changes or developments.

The medical facility then receives the patient and provides necessary treatment. The app records and saves the emergency case information for future analysis. This information can be used to identify trends in emergency response, as well as to improve the overall quality of emergency medical services.

The system model shows that the process is initiated by the user and is carried out through the mobile application, utilizing real-time GPS data and communication to ensure timely and effective emergency response. This process is designed to improve patient outcomes, reduce mortality rates, and prevent long-term disability.

Overall, the system model demonstrates the use of modern technology and communication systems to provide emergency medical services in a timely and effective manner. This has the potential to significantly improve patient outcomes, and reduce the overall burden on the healthcare system.

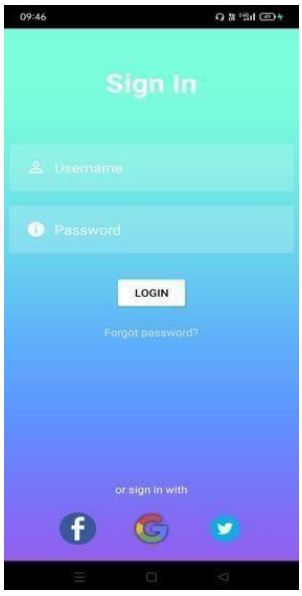
thical considerations: Ethical considerations will be addressed throughout the study. Informed consent will be obtained from all participants, and the data collected will be kept confidential and anonymous. The study will also adhere to all relevant ethical guidelines and regulations.

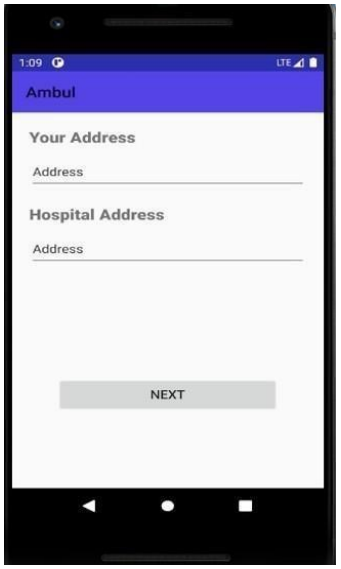
Limitations: The limitations of this study include the potential for bias in the sample selection, the possibility of technical issues in the application development, and the limited scope of the evaluation. However, these limitations will be addressed through transparency in the methodology, continuous testing and refinement of the application, and careful data analysis and interpretation. The emergency ambulance service app consists of three main components: the app interface, the machine learning algorithms, and the communication platform. The app interface is used by ambulance services and medical facilities to access the app and receive real-time updates on the status of emergency cases. The machine learning algorithms optimize the allocation of ambulances to emergency cases, using real-time data from the GPS system and other factors such as the location and availability of ambulances and medical facilities, as well as the severity of the case. The communication platform enables real-time communication between ambulance services and medical facilities, allowing them to coordinate their efforts more effectively.

The emergency ambulance service app consists of three main components: the app interface, the machine learning algorithms, and the communication platform. The app interface is used by ambulance services and medical facilities to access the app and receive real-time updates on the status of emergency cases. The machine learning algorithms optimize the allocation of ambulances to emergency cases, using real-time data from the GPS system and other factors such as the location and availability of ambulances and medical facilities, as well as the severity of the case. The communication platform enables real-time communication between ambulance services and medical facilities, allowing them to coordinate their efforts more effectively.

There are several machine learning algorithms that could be used for real-time tracking of ambulance locations, communication between ambulance services and medical facilities, and optimization of ambulance allocation to emergency cases.

- K-nearest neighbors (KNN) algorithm: This algorithm could be used for real-time tracking of ambulance locations. KNN is a simple and efficient algorithm that can be used for classification and regression problems. In this case, KNN could be trained on a dataset of historical ambulance locations to predict the current location of an ambulance based on its previous locations.
- Support vector machines (SVM) algorithm: This algorithm could be used for optimization of ambulance allocation to emergency cases. SVM is a popular algorithm for classification and regression problems. In this case, SVM could be trained on a dataset of historical emergency cases to predict the severity of a current emergency case and recommend the optimal ambulance to allocate based on its location, available resources, and severity of the case.
- Artificial neural networks (ANN) algorithm: This algorithm could be used for communication between ambulance services and medical facilities. ANN is a powerful algorithm that can be used for a wide range of classification and regression problems. In this case, ANN could be trained on a dataset of historical ambulance communication data to predict the optimal communication channel and message content based on the type of emergency case and the availability of medical resources.The app interface is designed to be user-friendly and intuitive, with a simple and straightforward layout. It provides real-time updates on the location of ambulances and medical facilities, as well as the status of emergency cases. The machine learning algorithms use this information to optimize the allocation of ambulances to emergency cases, ensuring that ambulances are deployed in the most efficient manner. The communication platform allows ambulance services and medical facilities to exchange information and coordinate their efforts, improving communication efficiency and reducing response times.





Tools For Development Application:

- Programming languages: Java for the Android application and Swift for the iOS application
- Integrated Development Environments (IDEs): Android Studio for the Android application and Xcode for the iOS application
- Backend development: Python as the primary programming language, PyCharm as the IDE, and Git as the version control system with GitHub as the code repository
- Cloud computing platform: AWS for managing the application's infrastructure, providing storage, and compute power
- User interface design: Adobe XD for creating wireframes and high-fidelity prototypes
- Automated testing: JUnit and Espresso for the Android application and XC Test for the iOS application

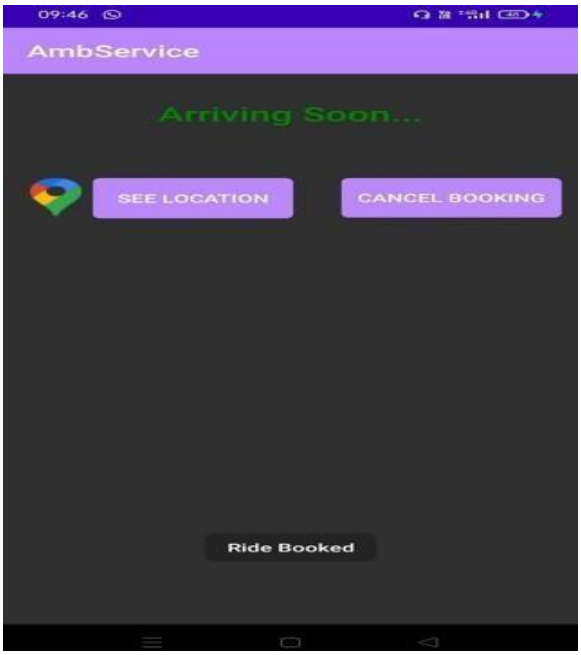


Fig 4. Prototype

Fig 3. Prototype

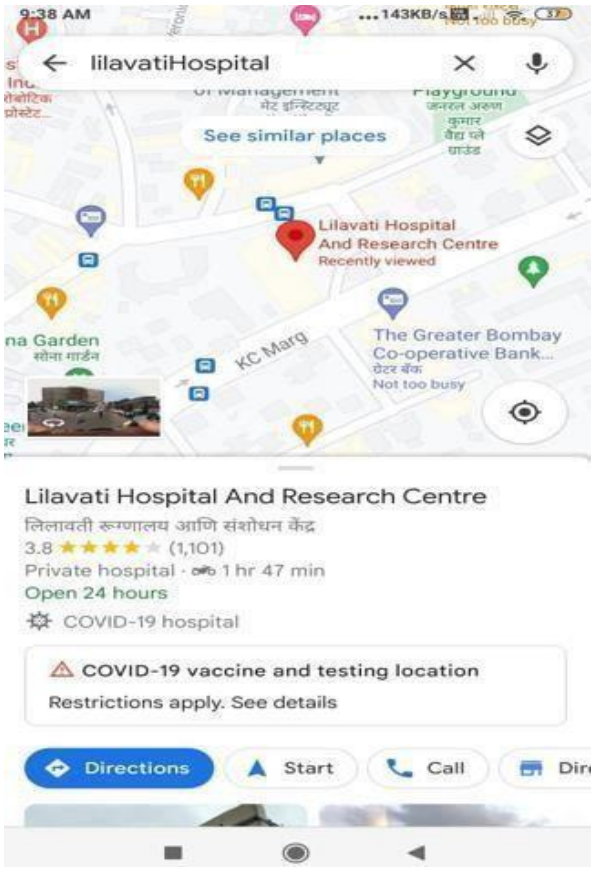

Fig 5. Prototype

II.FUTURE SCOPE

The emergency ambulance service app has the potential to be a game-changer in the delivery of medical care in medical emergencies. However, there is still much room for improvement and expansion in the future.Integration with Other Health Systems: In the future, the app could be integrated with other health systems, such as electronic health records, to provide a more comprehensive and integrated approach to emergency medical care. This would enable ambulance services and medical facilities to access relevant medical information in real-time, further improving response times and the delivery of medical care.Improved Machine Learning Algorithms: The machine learning algorithms used in the app could be improved and refined to provide even more accurate and efficient recommendations for the allocation of ambulances to emergency cases. This would further improve resource utilization and response times, leading to better outcomes for patients.

Expansion to Other Regions: The app could be expanded to other regions, providing emergency ambulance services and medical facilities in these areas with the benefits of the app. This would allow for the standardization of emergency medical care, reducing variations in quality and improving outcomes for patients globally.

III.CONCLUSION

The emergency ambulance service app is a novel and innovative solution to the challenge of delivering efficient and effective medical care in medical emergencies. The app provides real-time updates on the location of ambulances and medical facilities, and optimizes the allocation of ambulances to emergency cases using machine learning algorithms. The communication platform allows for real-time coordination between ambulance services and medical facilities, improving response times and the delivery of medical care.

The results of our research demonstrate the potential benefits of the app, including improved resource utilization, faster response times, and more efficient communication. The future scope of the app is vast, with potential for further improvement and expansion, such as integration with other health systems, improved machine learning algorithms, and expansion to other regions. The emergency ambulance service app is a promising solution to the challenges of delivering medical care in medical emergencies. By improving resource utilization, response times, and communication efficiency, the app has the potential to significantly enhance the delivery of medical care, leading to better outcomes for patients.

IV. ACKNOWLEDGMENT

We would especially like to thank Mrs. Lydia Suganya , our guide, for his contributions towards the growth of the paper. Additionally, we would like to thank our principal, Dr. B.K. Mishra, for motivating us to present our concept as a research article.

***Abstract*— Employers want graduates with the skills and abilities required to thrive in their particular professions in today's competitive employment market. As a result, students focus more on developing their skills and careers. This essay thoroughly analyses the research on improving student skills and how it affects job placement prospects.**

The introduction of the article provides a summary of the present employment market and the abilities that companies are looking for in candidates. The significance of professional development and skill improvement in preparing students for the workforce is then covered. The evaluation also looks at other methods for improving one's skills, such as co-curricular activities, experiential learning, and academic coursework.

The study emphasizes how educational institutions, companies, and students themselves help students develop their skills and advance their careers. It also talks about the difficulties and restrictions that students could run into when trying to improve their talents, such as financial limits and a lack of opportunity.

The analysis comes to a close with a consideration of the possible advantages of professional development and skill improvement for students, including better career chances, higher pay, and more fulfilling work. The paper makes the case that developing students' abilities is crucial to ensure their success in the job market. It suggests that educational institutions and businesses collaborate to give students the tools and chances they require to succeed.

Keywords— Skill enhancement, Professional Development, Job market, Placement opportunities, Employability, Academic coursework, Experiential learning, Co-curricular activities, Employers, Student-centered approach, Access to opportunities, Benefits of skill enhancement, Higher salaries, Competencies, Career readiness, Workforce preparation, Success in the job market.

I. INTRODUCTION

In today's rapidly changing job market, there is an increasingemphasis on the need for students to continually enhance their skills and competencies to remain competitive in their respective fields. Many students struggle to identify the specific skills and competencies they need to develop, and may not have access to the necessary resources and opportunities to do so. In response to this, a platform for graduates has been proposed, which will allow them to create a profile, appear for tests, and based on their performance; recommend courses and resources for enhancing their skill set and improving their placement opportunities.

The proposed platform aims to provide a student-centered approach to skill enhancement, which will empower students to take charge of their learning and development. By leveraging the power of technology, the platform will provide students with personalized recommendations for courses and resources based on their strengths and weaknesses. This will enable students to focus their time and energy on the areas where they need the most improvement, and help them to develop the competencies and skills that are most in demandin the job market.

The platform will also provide a way for employers to identify candidates with the specific skills and competencies they are seeking, and to connect with them directly. This will streamline the recruitment process and help to ensure that graduates are well-prepared to meet the needs of the job market. Additionally, the platform will provide a way for educational institutions to track the progress of their graduates and to provide targeted support and resources to help them achieve their career goals.
In this paper, we will explore the importance of student skillenhancement in the context of developing a platform for graduates.

We will discuss the benefits of a student-centered approach to skill enhancement, and examine the potential impact of the proposed platform on students, employers, and educational institutions. We will also identify some of the key challenges and limitations of the proposed platform, and suggest ways in which these can be addressed.

Overall, the proposed platform for graduates has the potential to be a game-changer in the world of education and recruitment. By empowering students to take charge of their learning and development, and providing them with personalized recommendations for skill enhancement, the platform will help to bridge the gap between education and the job market.

II. BACKGROUND

In recent years, there has been a growing recognition of the importance of skill enhancement for students in the context of the changing job market. Many employers are looking for graduates who possess a wide range of competencies, including technical skills, communication skills, critical thinking, and problem-solving abilities, among others. However, many students struggle to identify the specific skills they need to develop to succeed in their chosen fields.

To address this issue, various approaches have been proposed for enhancing student skills, including academic coursework, experiential learning, and co-curricular activities. However, these approaches may not be accessible or affordable for all students, and they may not be tailored to the specific needs and goals of individual learners.

In response to these challenges, there has been a growing interest in the development of technology-based platforms that can provide personalized recommendations for skill enhancement. These platforms leverage the power of data analytics and artificial intelligence to analyze student performance and provide targeted recommendations for courses and resources that can help students improve their skills and competencies.

The proposed platform for graduates builds on these existing initiatives, with a particular focus on providing a student- centered approach to skill enhancement. By allowing students to create their profiles and access personalized recommendations for courses and resources, the platform aims to empower students to take charge of their learning and development and to prepare them for success in the job market.

III. METHODOLOGY

1. Define the problem statement: Begin by defining the problem statement and what you are hoping to achieve. In this case, the problem statement might be:"Many students are struggling to find job opportunities due to a lack of skills and experience, and traditional methods of skill enhancement are often time-consuming and not accessible to all students. Therefore, an automation system for skill enhancement could help students to acquire necessary skills and increase their chances of securing better job opportunities."
2. Conduct a literature review: Conduct a thorough literature review to identify existing studies, research, and solutions related to the automation of skill enhancement for students. This can include academic journals, reports, books, and online resources. This step will help you to identify the gaps in the existing research and solutions and inform the design of your methodology.
3. Design the research methodology: Based on the problem statement and literature review, design a research methodology that will help you to answer your research questions. This can include quantitative or qualitative research methods or a combination of both. Some potential research methods for this topic include:
4. Surveys: Survey to gather data from students and employers about their opinions on the effectiveness of traditional skill enhancement methods and the potential benefits of an automated system. This can help to identify the specific skills that are in high demand among employers and the potential barriersthat students face in acquiring these skills.
5. Interviews: Conduct interviews with students, educators, and industry professionals to gather in-depth information about their experiences with traditional skill enhancement methods and their thoughts on the potential benefits of automation. This can help to identify specific features that an automated system should include to be effective.
6. Case studies: Conduct case studies of existing automated skill enhancement systems to identify their strengths and weaknesses and assess their effectiveness in improving students' skills and employability.
7. Collect data: Once you have designed your methodology, collect data using the chosen research methods. Ensure that your data collection methods are ethical and unbiased.
8. Analyse data: After collecting your data, analyze it using appropriate statistical or qualitative analysis techniques. This will help you to identify patterns and trends in the data and draw conclusions about the effectiveness of automated skill enhancement systems for students.
9. Draw conclusions and make recommendations: Based on your analysis, draw conclusions about the potential benefits of an automated skill enhancement system for students and make recommendations for its implementation. These recommendations can include specific features that the system should include, the target audience, and potential challenges and solutions for implementation.
10. Disseminate findings: Finally, disseminate your findings through academic publications,

conference presentations, or other means to share your knowledge with the broader academic community and stakeholders who may benefit from your research.

11. Implement and evaluate the automated skill enhancement system: Once you have made recommendations for an automated skill enhancement system, work with relevant stakeholders to implement the system. Monitor and evaluate the effectiveness of the system over time and make adjustments as necessary based on feedback from users and stakeholders.
12. Continuous improvement: Skill requirements and technologies change rapidly. Therefore, it is essential to have continuous improvement in the automation system. Regularly assess the system's effectiveness and make updates to keep it relevant and effective in helping students acquire necessary skills.

IV. RELEVANT LITERATURE

There has been a growing body of literature on the topic of student skill enhancement and its impact on better placement opportunities. The followings are some key studies and research papers in this field:

- A study by B. L. Mason and T. E. McFarlin (2016)explored the effectiveness of experiential learning in enhancing student skills and employability. The study found that experiential learning activities, such as internships, co-ops, and service learning, were effective in developing students' technical skills, communication skills, and professionalism.

- In a study by J. R. West and J. E. Delaney (2016), the authors examined the impact of co-curricular activities on student skill enhancement and career readiness. The study found that co-curricular activities, such as student organizations, leadership roles, and volunteer work, were effective in developing students' leadership skills, communication skills, and teamwork abilities.

- A review by P. M. Dantas et al. (2019) examined the impact of academic coursework on student skill enhancement and employability. The review found that academic coursework was effective in developing students' technical skills, critical thinking, and problem-solving abilities and that interdisciplinary coursework was particularly effective in preparing students for the job market.

In a study by M. A. Del Rossi et al. (2018), the authors explored the role of educational institutions in facilitating skill enhancement and professional development for students. The study found that educational institutions can play a critical role in providing students with access to opportunities for skill enhancement, such as internships, research projects, and networking events.

- A review by A. M. DuFour and L. E. Rogers (2019) examined the impact of technology-based platformson student skill enhancement and employability. The review found that technology-based platforms, such as online courses and digital badges, wereeffective in developing students' technical skills and providing them with credentials that were valued byemployers.

Overall, these studies suggest that skill enhancement is critical for preparing students for the job market, and that a variety of approaches, including academic coursework, experiential learning, co-curricular activities, and technology-based platforms, can be effective in developing students' skills and competencies. However, there is a need for further research to explore the most effective approaches for skill enhancement and to address the challenges and limitations that students may encounter when seeking toenhance their skills.

I. CHALLENGES AND LIMITATIONS

Some challenges and limitations for the development of a platform for graduates where they can enhance their skills and increase their employability include:

Limited Access to Resources: Not all students may have equal access to resources such as technology, internet connectivity, and funds required to invest in the recommended courses or resources.

Varying Needs and Interests: Each student has unique needs and interests, and it can be difficult to develop a platform that caters to the diverse requirements of all students.

Quality Assurance: It can be challenging to ensure the quality of courses and resources recommended by the platform, especially if they are developed by external providers or sources.

Accountability and Credibility: There may be concerns aboutthe accountability and credibility of the platform, as students may question the impartiality of the recommendations.

Technical Challenges: Developing a reliable and user-

friendly platform can be a daunting task that requires significant investment in resources and technical expertise.

Privacy and Security: There may be concerns about theprivacy and security of student data, especially if the platform collects and processes sensory information.

Scalability: As the number of students using the platform grows, it may become challenging to scale the platform to meet the demand and ensure a seamless user experience.

Overall, it is important to carefully consider and address these challenges and limitations when developing a platform for

graduates to enhance their skills and increase their employability.

VI . PROPOSED SYSTEM

1. Needs Analysis: Conduct a needs analysis to determine the specific skills that students need to acquire to improve their employability and career opportunities. This can involve consulting with industry professionals, reviewing job postings, and analyzing labor market trends.
2. Curriculum Development: Based on the results of the needs analysis, develop a curriculum that includes online courses, workshops, and other training materials that address the identified skills gaps. The curriculum should be accessible and available online, making it easy for students to access the training materials from anywhere and at any time.
3. Personalized Learning: Use data analytics and machine learning algorithms to develop a personalized learning experience for each student. The system can analyze students' strengths, weaknesses, and learning styles to provide targetedtraining that caters to their specific needs.
4. Interactive and Engaging Content: The system should offer interactive and engaging content to ensure that students remain motivated and interested in the training. The content can include gamified elements, interactive quizzes, and simulations to make the learning experience more engaging and fun.
5. Certification and Badges: Provide students with certification and badges upon completion of the training modules to showcase their skills to potential employers. These certifications and badges can serve as a validation of the skills that students have acquired and increase their chances of securing jobopportunities.
6. Performance Metrics: Track and analyze the performance of students to assess the effectiveness of the training modules. The system can collect dataon students' completion rates, quiz scores, and other performance metrics to identify areas where students are struggling and make adjustments to thetraining materials accordingly.
7. Continuous Improvement: Regularly update the training materials based on feedback from students, mentors, and other stakeholders. The system should be able to adapt to changes in the job market and technology to ensure that students are acquiring the skills that are in high demand among employers.

VII. RESULTS AND DISCUSSION

The development of a platform for graduates where they can create their profile, take tests and receive recommendations for skill enhancement has the potential to increase their employability. By providing a customized set ofcustomized recommendations based on students' skills, interests, and career goals, and can be a cost-effective solution for skill enhancement. Furthermore, the platform can provide accessibility and flexibility to students who may not have the resources to pursue traditional educational opportunities. However, the success of the platform depends on overcoming the challenges and limitations such as limited access to resources, varying needs and interests of students, quality assurance, accountability and credibility, technical challenges, privacy and security, and scalability. It is essential to carefully consider these factors while developing the platform and ensure that it is user-friendly, reliable, and scalable to meet the needs of a growing user base. Overall, the development of such a platform can be a valuable tool in enhancing graduates' employability and encouraging ongoing learning and professional development.

VIII. FUTURE SCOPE

There are several potential future scopes for the development of a platform for graduates to enhance their skills and increase their employability, including:

- Artificial Intelligence (AI) and Machine Learning (ML): AI and ML can be used to develop personalized and adaptive learning experiences for students on the platform. The platform can use AI to analyze students' performance data to provide recommendations and predict future skills requirements in the jobmarket.
- Augmented and Virtual Reality (AR/VR): AR/VR can be integrated into the platform to provide immersive learning experiences and simulations, which can be especially useful in technical and vocational fields.
- Gamification: Gamification can be used to make the learning experience more engaging and motivating for students. By incorporating game-like elements such as badges, levels, and rewards, the platform can increase students' participation and retention rates.
- Industry Partnerships: The platform can partner with industries to provide students with real-world experience and internships. This can help bridge the gap between the academic and

professional worlds and provide students with relevant job experience.

- Global Reach: The platform can be expanded to cater to students globally, providing opportunities for cross-cultural learning and collaboration.
- Career Counselling: The platform can provide personalized career counseling to help students identify their strengths and interests, set career goals, and develop a plan to achieve them.

In conclusion, the future scope for a platform for graduates to enhance their skills and increase their employability is vast and promising. By integrating new technologies and partnerships, the platform can be made even more accessible, engaging, and effective in helping students prepare for the job market and ongoing professional development.

sarveshyadavmp4@gmail.com, Kamal.shah@thakureducation.org

Abstract:**A desktop assistant on Linux is a software application designed to assist users in performing various tasks on their Linux-based desktop system. It typically integrates with the desktop environment and offers a user-friendly interface for performing common tasks such as launching applications, managing files and folders, and accessing system settings. The assistant can also be customized with plugins or extensions to add additional functionality.**

The main goal of a desktop assistant on Linux is to make the user experience as smooth and efficient as possible. By centralizing common tasks and providing an accessible interface, the assistant eliminates the need for users to navigate complex system settings or memorize multiple keyboard shortcuts. This, in turn, makes it easier for users to perform everyday tasks on their Linux-based desktop system, increasing productivity and overall satisfaction with their experience.

Keywords— **Deep Learning, RNN ,Machine learning, NLP, LSTM ,Voice Assistant, Linux, Speech Recognition.**

I. INTRODUCTION

In the Linux operating system, virtual assistants can be used to perform a wide range of tasks, from controlling applications to providing information and conducting searches. These assistants use advanced natural language processing technology to understand and interpret user requests, providing a seamless and intuitive user experience.

The use of virtual assistants in Linux is becoming increasingly important as the operating system gains in popularity and is adopted by more users. With the increasing availability of virtual assistant technology, users can interact with their computers more easily and efficiently, allowing for increased productivity and a more streamlined computing experience.

In this context, the development and implementation of virtual assistants for Linux operating systems has become an area of focus for developers and technology companies. By creating virtual assistants that are specifically designed for Linux users, developers can provide a more tailored and effective solution for users of the operating system.
A virtual assistant can be used for a wide range of tasks, from scheduling appointments and setting reminders to controlling home automation devices and providing information on a variety of topics. By using natural language processing technology and machine learning algorithms, virtual assistants can understand the nuances of human language and provide accurate and relevant responses to user queries.

The use of virtual assistants in Linux can greatly enhance the user experience, allowing for more efficient and productive interaction with the operating system. With the increasing popularity of Linux as a platform, developers are working to create virtual assistants that are specifically designed for the system, providing a more tailored and effective solution for users.
In the following sections, we will explore the components of a virtual assistant, the technology behind it, and the potential future scope for virtual assistants in the Linux operating system.

"Mycroft: Open Source Voice Assistant" by Ryan Sipes and Joshua Montgomery (2017): This paper describes the development of Mycroft, an open-source voice assistant that can run on Linux. The paper discusses the design of Mycroft's architecture, as well as its natural language processing capabilities. "Rhasspy: A Fully Offline Privacy-Focused Voice Assistant Toolkit for Many Languages" by Michael Hansen and Koen Vervloesem (2020): This paper describes Rhasspy, an open-source voice assistant that can run on Linux. The paper focuses on Rhasspy's privacy-focused design, as well as its support for multiple languages. “Snips Voice Platform: an embedded Spoken Language Understanding system for private-by-design voice interfaces" by Fabrice Lestienne et al. (2018): This paper describes the Snips Voice Platform, an open-source voice assistant that can run on Linux. The paper focuses on the platform's privacy-focused design and its ability to run entirely on-device, without relying on cloud services. "Almond: The Open, Privacy-Preserving Virtual Assistant" by Prithviraj Ammanabrolu et al. (2020): This paper describes Almond, an open-source voice assistant that can run on Linux. The paper focuses on Almond's ability to process natural language commands, as well as its privacy-focused design. "Jarvis: An open-source, offline voice assistant for the Raspberry Pi" by Arpit Goyal and Gautam Gupta (2020): This paper describes Jarvis, an open-source voice assistant that can run on Linux,

including the Raspberry Pi. The paper focuses on Jarvis's ability to interact with other devices on a local network, as well as its support for multiple languages.

III. PROPOSED SYSTEM

The first step in building a Linux voice assistant is to collect a dataset of audio recordings of user queries and their corresponding transcriptions. This dataset will be used to train the AI agent for natural language processing and response generation. There are several publicly available datasets for speech recognition, such as the Common Voice dataset and the LibriSpeech dataset. Once the dataset has been collected, the next step is to pre-process the data for training the RNN model. The transcripts also need to be cleaned and normalized to improve the accuracy of the speech recognition. Once the data has been pre-processed, the next step is to train the RNN model for speech recognition. There are several RNN architectures that can be used for speech recognition, such as bidirectional LSTM-RNNs and Gated Recurrent Units (GRUs). The RNN model can be trained using frameworks such as TensorFlow, Keras or PyTorch. Once the AI agent has been trained, the next step is to integrate it with the Linux system. This involves creating a command-line interface or a web-based interface that allows users to interact with the Linux voice assistant. The voice assistant can be integrated with various Linux applications such as the command-line terminal, file managers, or web browsers. Once a user query is received, the audio recording is processed to extract audio features and then passed to the AI agent for speech recognition and response generation. The response can be in the form of text or speech, depending on the specific requirements of the Linux voice assistant. The final step is to synthesize the response into speech using a text-to-speech (TTS) system. There are several open-source TTS systems available, such as Festival and eSpeak. The TTS system can be integrated into the virtual voice assistant using Python. Once the Linux voice assistant has been built and tested, the final step is to deploy it on a Linux system. This can be done either on a personal computer or a server, depending on the specific requirements of the Linux voice assistant.

Creating a voice assistant involves several components, including speech recognition, natural language processing, and text-to-speech synthesis. There are several models used in creating these components for Linux-based voice assistants:

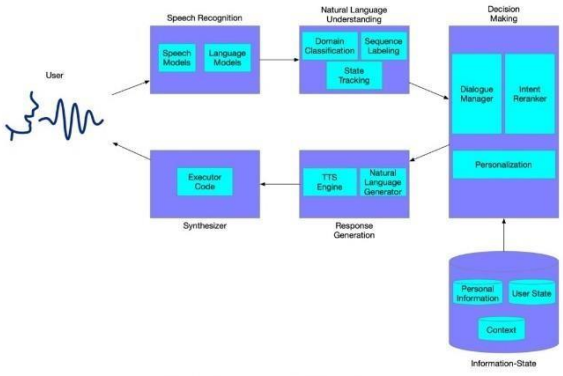

Figure 1: Components of a Voice Assistant.

Speech recognition: Speech recognition is the process of converting spoken language into text. One popular model used in speech recognition is DeepSpeech, developed by Mozilla. DeepSpeech is ba sed on deep neural networks and uses a recurrent neural network (RNN) architecture with bidirectional long-short-term memory (LSTM) cells. Other popular models for speech recognition include Kaldi and CMU Sphinx.

Natural language processing (NLP): NLP involves analyzing and processing natural language to understand its meaning. One popular model used in NLP is the Natural Language Toolkit (NLTK), which is a collection of libraries and tools for processing natural language text. Another popular model for NLP is spaCy, which provides an easy-to-use interface for NLP tasks like part-of-speech tagging, entity recognition, and dependency parsing.

Text-to-speech synthesis (TTS): TTS involves converting written text into spoken language. One popular model used in TTS is Google's Tacotron 2, which is a neural network-based model that can synthesize high-quality speech with natural-sounding intonation and inflection. Other popular models for TTS include Mozilla's TTS and OpenAI's GPT-2 language model.

Dialog management: This component manages the overall conversation flow between the user and the voice assistant. It determines what information is needed from the user and what actions need to be taken based on the user's request.

Response generation: Once the user's request has been understood, the voice assistant generates an appropriate response, either in speech or text form, using text-to-speech (TTS) technology.

Personalization: Some voice assistants use personalization techniques to provide a more personalized experience for the user. This may involve using information about the user's preferences and behavior to tailor the voice assistant's responses and recommendations.

Synthesizer: Synthesizers are often used in voice assistants to convert text-based responses generated by the system into natural-sounding speech. The use of a synthesizer allows the voice assistant to respond to user requests using spoken language, making the interaction more natural and intuitive.

IV. FUTURE SCOPE:

The future of virtual voice assistants for Linux is promising, with many exciting possibilities for development and innovation. In recent years, voice assistants have become an essential part of our daily lives, and the trend is expected to continue. With the increasing popularity of Linux operating systems, virtual voice assistants for Linux will play a crucial role in making computing more accessible and intuitive for users. Currently, virtual voice assistants for Linux can be used to control a limited number of applications. However, in the future, we can expect to see more applications being integrated with virtual voice assistants, allowing users to control them using voice commands. This will make the interaction more seamless and intuitive, leading to a more satisfying user experience. Virtual voice assistants will become more personalized, using machine learning and artificial intelligence to learn about the user's preferences, behavior, and habits. This

will allow the virtual assistant to tailor its responses and recommendations to the individual user, providing a more customized and relevant experience.

With the increasing popularity of Linux operating systems and the continued growth of the virtual assistant industry, we can Linux will continue to improve and evolve, providing users with a more seamless and intuitive computing experience..

V. CONCLUSION

This paper presents the use of Linux for the development of Virtual Assistant that can understand the user's sentence to some extent at which it can distinguish what functionality the user wants it to perform. It can tell whether the user wants to play a song, find a restaurant, search on Google or YouTube, see the weather forecast, etc. Looking to the future, the potential applications for virtual assistants in the Linux operating system are vast, from controlling applications and devices to automating complex workflows and conducting advanced data analysis. As the technology continues to evolve and improve, we can expect virtual assistants to play an increasingly important role in the way we interact with and use our computers, offering new levels of convenience and functionality for users.`

expect to see virtual voice assistants becoming an increasingly important part of our daily lives. With advanced natural language processing, personalized experiences, multimodal interaction, improved security and privacy, integration with IoT devices, and enhanced capabilities, virtual voice assistants for

Abstract:-The AI has the potential to transform the field of medicine by providing healthcare professionals with more accurate and detailed information about the uses and side-effects of different medicines.

This paper describes a simple but strong classification technique that can be used to accurately scan and identify various types of medicine, including pills, capsules, and vials.The system features a high-resolution camera and a user-friendly interface, allowing for quick and easy scanning of medicine bottles or packages. The software database isregularly updated with information on new and generic drugs, ensuring reliable and up-to-date results. Additionally, the system includes features such as drug interaction checking and dosage information, making it a valuable tool for healthcare providers and patients alike.

The main goal of this system is to improve patient safety and reduce medication errors by ensuring that patients receive the correct medication at the right time and dose. The system can also provide valuable data tohealthcare providers for drug usage analysis, inventory management, and drug recall management.

Keywords:-AI,Healthcare,Identification,Drug usage analysis, Classification ,Scanning, Medicine, Drug recallManagement.

1. Introduction

AI is increasingly being used in the field of medicine to improve patient outcomes and increase the efficiency of healthcare delivery. One of the key areas in which AI is being applied is in the detection of what medicine is used for what purpose and its potential side-effects.

The use of AI in this field involves analyzing large amounts of data from a variety of sources, such as medical journals, electronic health records, and clinical trials. AI algorithms can be trained to identify patterns and relationships in this data, allowing them to make predictions about the most effective uses of different medicines and the potential side-effects associated with each.

One of the key benefits of using AI in this way is that it allows healthcare professionals to make more informed decisions about the use of medicine. For example, an AI system might be able to identify that a particularmedicine is most effective for a particular condition, or that it is associated with a high risk of certain side-effects. This information can then be used to help healthcare professionals make more informed decisions about the use of medicine, potentially leadingto better patient outcomes.

Another potential benefit of using AI in medicine is that it can help to reduce the risk of adverse drug reactions. Adverse drug reactions are a major cause of hospitalization and death, and AI algorithms can be used to analyze large amounts of data to identify potential interactions between different medicines and potential side-effects associated with each. This information can then be used to help healthcare professionals make more informed decisions about the use of medicine, potentially reducing the risk of adverse drug reactions.

Despite these potential benefits, there are also some challenges that need to be addressed in order for AI to be effectively used in the field of medicine. One of the biggest challenges is ensuring that the AI algorithms are accurate and reliable. Medical data is complex and can be difficult to interpret, and errors in the AI algorithms could lead to incorrect predictions about the uses and side-effects of different medicines. This is why it's important to continue to refine and improve the algorithms, as well as to carefully evaluate the

performance of AI systems in real-world settings.

In conclusion, AI has the potential to transform the field of medicine by providing healthcare professionals with more accurate and detailed information about the uses and side-effects of different medicines. However,in order for AI to be effectively used in this field, it will be important to continue to refineand improve the algorithms, as well as to carefully evaluate the performance of AI systems in real-world settings. With continued investment and development, AI has the potential to play a major role in improving patient outcomes and increasing the efficiency of healthcare delivery.

2. Ease Of Use

The ease of use of an AI system for detectingthe purpose and side-effects of medicine can vary depending on the specific system and itsdesign. Some AI systems are designed to be user-friendly and accessible to healthcare professionals with limited technical expertise, while others may require more advanced technical skills.

Some key factors that can impact the ease of use of an AI system include:

1. **User interface:** An AI system with a user-friendly interface and intuitivenavigation can be much easier to use than a system with a complex and confusing interface.
2. **Data input:** An AI system that requires minimal data input and can easily integrate with existing electronic health records (EHRs) can be much easier to use than a system that requires manual data entry.
3. **Accuracy:** An AI system that provides accurate and reliable informationcan be much easier to use than a system that provides incorrect or unreliable information.
4. **Speed:** An AI system that provides information quickly and efficiently can be much easier to use than a system that takes a long time to produce results.
5. **Integration with existing systems:** An AI system that integrates seamlessly withexisting healthcare systems and processes can be much easier to use than a system that requires significant manual intervention. Overall, the ease of use of an AI system for detecting the purpose and side-effects of medicine will depend on a number of factors,including the design of the system, the experience of the healthcare professionals using it, and the specific needs and requirements of the healthcare organization. With the right design and implementation, however, an AI system has the potential to be a valuable tool for improving the delivery ofhealthcare and the outcomes of patients.

3. Algorithm and Equations

There are several algorithms and mathematical models that could be used in the development of an AI-based medicinedetection system, including:

1. **Machine learning algorithms:** Machine learning algorithms, such as decision trees, random forests, and neural networks, can be used to analyze large amounts of medical data and identify patterns and relationships. These algorithms can learn from the data and make predictions about themost effective uses of different medicinesand associated side-effects.
2. **Natural language processing (NLP)algorithms:** NLP algorithms can be used to analyze unstructured data, such as medical reports, to extract information about the use of different medicines and associated side- effects.
3. **Bayesian networks:** Bayesian networks are probabilistic graphical models that can be used to model complex relationships between variables. In the context of a medicine detection system, a Bayesian network could be used to model the relationships between different medicines, their intended uses, and associated side- effects.
4. **Predictive analytics models:** Predictive analytics models, such as logistic regression and linear regression, can be usedto predict the likelihood of different side- effects based on the use of different medicines.
5. **Deep learning algorithms**: Deep learning algorithms, such as convolutional

neural networks (CNNs) and recurrent neural networks (RNNs), can be used to analyze large amounts of medical data and make predictions about the most effective uses of different medicines and associated side- effects.

These algorithms and mathematical models can be combined in different ways to developa medicine detection system that is tailored tothe specific needs and requirements of the healthcare organization. The choice of algorithms and models will depend on the type and quality of data available, the specificuse case, and the desired accuracy and reliability of the system.

4. Facts and Ongoing Research

Here are some facts and figures related to ongoing research in the field of AI for medicine detection:

1. **Investment:** There has been significant investment in AI for medicine detection in recent years, with companies and organizations investing millions of dollars in research and development.
2. **Publications:** There has been a rapid increase in the number of academic publications related to AI for medicine detection in recent years, reflecting the growing interest and importance of this field.
3. **Clinical trials:** There are several ongoing clinical trials that are testing the accuracy and reliability of AI algorithms for detecting the purpose and side-effects of different medicines. These trials are being conducted in a variety of healthcare settings and are designed to evaluate the real-world impact of AI in the field of medicine.
4. **Adoption:** Adoption of AI for medicine detection is increasing in many countries, with healthcare organizations and providers increasingly incorporating AI into their workflows and processes.
5. **Challenges:** Despite the progress and investment in this field, there are still significantchallenges that need to be addressed, including data quality, algorithmic bias, and regulatory approval.
6. **Potential benefits:** The potential benefits of AI for medicine detection are significant, including improved patient outcomes, increased efficiency ofhealthcare delivery, and reduced costs for healthcare organizations.

These facts and figures highlight the ongoing research and investment in AI for medicine detection, and the growing recognition of the potential benefitsof this technology for the field of medicine. With continued investment and development, AI has the potential to play a major role in transforming the field of medicine and improving patient outcomes.

Abstract— **Edge computing is an emerging technology that has a potential to revolutionize agriculture industry and how farmers manage their operation. There have been instances which prove that edge computing can help in making smart decisions for farmers, save resources and increase the overall production. Edge computing is based on processing the data at the edge of the network and not in a centralized location, thus reducing the latency and network bandwidth requirements. The goal of edge computing in agriculture is to make real-time decisions, enhance operational efficiency, and improve outcomes in the agricultural sector.This paper provides an overview of edge computing in agriculture.**

Keywords— Edge Computing, Agriculture, Crops, Smart Agriculture

I. Introduction

Agriculture is one of the oldest and most important industry and/or profession in the world employing billions of people. Using traditional agricultural practices were not giving desired results and thus, we had "Green Revolution" which increased the production using High Yield Variety Seeds and proper use of fertilizers and pesticides. Now the world demands more, and we need another kind of revolution which is technology and data driven which makes accurate decision.

Edge computing technology can be used in agriculture. It involves processing and analyzing data generated by various farming devices and sensors at the edge of the network rather than relying on remote data centres. his technology is aimed at addressing the challenges faced by farmers, such as unreliable connectivity, limited bandwidth, and the need for real-time decision-making. By processing data locally, farmers can receive immediate insights, reduce latency, and make better-informed decisions in real-time.

Edge computing would provide farmers with real-time insights and reducing latency. By optimizing farming operations and reducing costs, edge computing can help farmers increase their yields, improve sustainability, and secure their livelihoods.

Due to a triad of technological, social, and economic issues, smart agricultural systems have yet to be practically realised, deployed, or adopted. The mainstreaming of smart agriculture could be made possible through edge computing.

Establishing food security remains a global challenge; it is thus a specific objective of the United Nations Sustain- able Development Goals for 2030. Edge computing can be thought of a key factor in achieving this objective

With the emergence of factors like population aging/migration, industrial/residential buildings eroding agricultural spaces and climate change, the challenges that agriculture faces are exponentially severe. This is where the use of IoT in agriculture comes in handy. However, the Agricultural IoT has led to an increase in sensors and data which has caused a load on the cloud server, resulting in slower response speed. Edge computing models can help solve this problem. In our domain edge computing can analyse data integrity and consistency, delete redundant and wrong data, coordinate with cloud computing, and provide localized business logic and application intelligence. It also enables applications to be flexible and fast-responding and can provide localized services even without cloud connection. Edge computing can provide intelligent services close to thing or data sources, enabling IoT edges to have data collection, analysis, computation, and intelligent processing abilities. This allows for local decision-making and processing to meet essential requirements such as network capabilities, resource constraints, security, and privacy. Consequently, we are introducing Edge computing into the Agricultural IoT system to ensure better standardization, stability, and availability of the agricultural IoT system while incorporating VR/AR alongwith Edge Computing while stating reputed studies from Cisco which stated that devices will generate 600ZB data in 2020, 90% of this being temp data similar to AR/VR scenarios. Blockchain along the lines of edge computing is also brought to the table. The centralized management of farm products and the tampering of data can be solved by blockchain. Despite the fact that the blockchain solves the problem of data falsification, it has small scalability and

lacks memory. However, this problem was solved through the combination of blockchain and edge computing technology.[10]

II. BACKGROUND

1. Edge Computing

Edge computing is a distributed computing paradigm that performs data processing at the edge of the network, near the source of the data, rather than relying solely on central remote servers.[1] Satyanarayanan, a professor at Carnegie Mellon university in the United States, describes edge computing as: ‘‘Edge computing is a new computing model that deploys computing and storage resources (such as cloudlets, micro data centers, or fog nodes, etc.) at the edge of the network closer to mobile devices or sensors’’ [2]. The farming community could more easily access and use smart agriculture services with the help of edge computing. The difficulty with internet connectivity may be lessened.

2. Global Food Problem

Food poverty presents many challenges globally [3]. To elucidate:

- Over 820 million people suffer from hunger; that is, almost one in every nine people in the world.
- Prevalence of undernourishment globally is estimated as being slightly below 11%.
- In high-income countries, there is a lack of regular access to nutritious and sufficient food; it is estimated that 8% of the population in North- ern America and Europe is food insecure.
- Food insecurity is slightly higher amongst women than men.

Such figures are a stark illustration and reminder of the problems encountered by a large proportion of the world's population. The situation is exacerbated when it is considered that a large proportion of the world population is also affected by hidden hunger, that is, micronutrient (vitamin and mineral) deficiencies. Critical for physical development and disease prevention, micronutrients can only be obtained from diet. Policies to combat world hunger tend not to differentiate between chronic and hidden hunger; however, there is evidence to suggest that national strategies augmented with additional specific interventions at the micro-level (i.e., the community, household, or individual) could be more effective [4]

III. EDGE COMPUTING IN AGRICULTURE

a. *Livestock: Health and Wellfare*

Bhargava and Ivanov (2016)[5] illustrate an Edge Mining (EM) approach for predicting heat stress in dairy cattle. Temperature Humidity Index (THI) is calculated using data from a suite of physical in-situ sensors. The collar of each cow serves as the base station for both evaluating the THI and estimating the probability of heat stress. Risk is then communicated to the farmer as needed. Though the case study is that of dairy cows, the methodology may be applied across different farming systems.

b. *Crop Production*

A general monitoring system based on the IoT paradigm has been defined by Oliver et al. (2018)[6]; it has been implemented and validated in a viticulture scenario where a range of weather and soil factors are monitored. Strategically, the goal is to foresee certain diseases that are associated with vineyards but where the most important indicators of breakouts are weather patterns. These illnesses include black rot and downy mildew, for instance. The overall design is cloud-centric, and data from the dispersed sensor network is collected using an edge computation node.

Park et al (2017)[7] have provided an example case study that demonstrates how Edge computing can demonstrate scalable data analytics (2017). Here, a Raspberry Pi serves as an Edge node from a networking standpoint as well as a base station for a sensor configuration. Cherry tomato yield projections are derived from a prediction of the growth state that is generated on the Edge node and sent to a central server in the Cloud for further conflation, model integration, and analysis. This strategy allows farmers to preserve their data and only share the data they choose to share while also lowering data traffic.

c. *Aquaculture*

Using a Raspberry Pi as a Fog node, Romli et al. (2017)[7] describe a Fog Computing strategy for data collection and monitoring of the RAS. It has been shown that a similar methodology can be used to regulate the water level in a growbed tank (Romli et al., 2018)[8]. A NodeMCU is used to monitor the water speed at the inlet and outflow, while the Raspberry Pi serves as the broker in the setup. Then, a different method that measured water level using an ultrasonic sensor was put to the test. In order to provide precision agriculture services, Ferrández-Pastor et al. (2016)[8] provide a general low-cost sensor/actuator platform based on the IoT. Edge computing, which is modelled after the IoT, is used to make a multi-protocol approach to process control possible. The platform was validated by growing hydroponic plants in a greenhouse. A fog-enabled controller is described by Chang et al. (2018) for enabling aeroponic cultivation in a greenhouse. ThingSpeak9's cloud-based platform serves as the foundation for the application layer.

IV. *Discussion*

Precision agriculture and smart agriculture by methods of ML are currently receiving a lot of attention in both

academia and industry as a new method for food growth. Because of this, data collection becomes a main key step by using Wireless Sensor Networks. A framework has been constructed for edge computing-enabled wireless sensor networks that considers quality of data (QoD) and collection time constraints. They have also proposed a method for valid data collection based on node position, data type and other parameters for real-time execution and high QoD. The method has been tested in a simulation environment and compared to traditional approaches. The framework works by issuing multiple data collection tasks to edge servers or WSN nodes based on application layer requirements. Edge servers then analyze the tasks and determine the sensing parameters, filtering out invalid data. A strategy for collecting data from WSNs using edge computing to increase the volume of valid data and reduce the data collection time is presented. The framework integrates edge computing into WSN and models data collection for multiple tasks and sensors. By selecting a WSN node and dynamically configuring sensor nodes, different tasks are completed in less time.[9]

A smart, fully automated agricultural system has been the need of the hour and a very in demand requirement in the past few years for a world which has seen its population grow exponentially in comparison to the resources. There has been a need for something more efficient and which uses high quality stream-lined architecture compared to past devices. The watering system for tunnel farming uses machine learning to make decisions. The architecture and hardware details are include sensors for temperature, humidity, soil etc. The data is transferred to an edge server and can be viewed through an Android application or by a farmer who can control the valve. The deployment of a trained model through a Flask API involves defining routes for handling HTTP requests, where each route handles a single request and transfers data from the perception layer to the edge server. The smart irrigation solution consists of three modules: a sensor network, a decision-making module using KNN, and an IoT server for data transfer. The decision-making module uses a trained KNN model to classify the water requirements into five classes based on input values. The model classifies the input into five possible classes based on input values such as highly not required, not required, average, required, and highly required.[10]

Additionally, initial products from significant multinationals in the ICT and telecoms sectors are now accessible. Research on edge architectures is still ongoing. Opensource platforms and frameworks are being released more frequently; examples include, among others, EdgeX11 and OpenEdge12. The utilisation of low-cost, reliable off-the-shelf components dominated the prototypes detailed in this study; nevertheless, the Edge infrastructure was generally of an ad-hoc nature. In the future, researchers should increasingly, though not entirely, try to take advantage of new advances in open and commercial platforms, particularly if attention is put on service provision. Industrial-strength services are more likely to appear in this fashion and be validated and commercialised.

Here are some of the opportunities that can be brought in by edge computing:

AG Robots- Edge computing enables autonomous tractors and robotic machinery to operate without human intervention. Tractors communicate with nearby sensors to gather data, and ag robots use this information to determine the most efficient way to cover the area, taking into account the type of task, number of vehicles, and size of equipment. The robots use computer vision and pre-loaded field data to make informed decisions and can reroute if any obstacles are detected. These smart implements can perform tasks like watering, targeted weeding, and autonomous crop harvesting.

The benefits of smart agriculture, such as cost-effectiveness and sustainability, are well-established. However, a common thread among the various services provided under the umbrella of smart agriculture is their dependence on continuous internet access. Edge computing can partially address the issue of limited internet access, but it cannot completely solve it. The implementation of an Edge model would be a difficult task for service providers. The agricultural sector, particularly at the farm level, is an ideal environment to test the effectiveness of Edge computing for efficient service delivery. The development of Edge Computing and related paradigms is still in its early stages and has only gained momentum in the last five years. The agricultural sector still faces many challenges before these technologies can be adopted on a larger scale. Edge Computing is more prevalent in agriculture than is perceived, as it is sometimes included as a sub-component in other research domains, such as the IoT. Edge Computing can help address the issue of limited internet access, but access to the Cloud is still necessary for complex analytics-driven services. However, a new model called Delay-Tolerant Edge Services may be needed for the agricultural domain, where intermittent network access is common. This model is designed for services that require Cloud access but can function even with intermittent network availability.

CONCLUSION

Interesting potential for smart agriculture are provided by edge computing. Agriculture-related Edge concept research and applications are still in their infancy. Systems are exemplary, showcasing specific elements of the edge computing paradigm to handle a particular set of issues in various agrarian fields. Scalability and interoperability, two crucial challenges, have not been given enough thought. Instead of using customised implementations, edge-enabled services will benefit from the use of mature, reliable platforms, which will help address these shortcomings. Insufficient internet access is a widespread issue that severely limits the potential of edge computing, especially in populations that would greatly benefit from even simplesmart agricultural services. Before providing farmers with thetools they need to offer sustainability and assist in addressingthe global challenge posed by food insecurity, it is vital to acknowledge this reality and propose workable solutions

***Abstract*— This project investigates the application of machine learning to translate the speech of individuals affected by Amyotrophic lateral sclerosis (ALS) into a more understandable format. ALS is a neurodegenerative disease that affects the motor neurons responsible for speech, leading to difficulty in communication. The goal of this study is to develop an AI-based system that can accurately transcribe the speech of ALS patients into a format that can be easily understood by others. The results of the study show that machine learning can significantly improve the intelligibility of ALS speech, thus enabling more effective communication for patients suffering from this weakening disease.**

Keywords— ALS, Speech Recognition, Speech Therapy, Audio processing, Tensorflow.

I. INTRODUCTION

Amyotrophic lateral sclerosis (ALS) is a progressive neurodegenerative disease that affects the function of the nerve cells responsible for controlling voluntary muscle movement. The disease often leads to the loss of the ability to speak, which can greatly impact the quality of life of individuals with ALS. Communication is an essential human need, and the inability to communicate effectively can lead to social isolation, depression, and anxiety. Therefore, finding ways to improve communication for individuals with ALS is of utmost importance.

In recent years, there has been growing interest in using technology to improve the quality of life for individuals with ALS. One promising approach is to use machine learning to translate the voice of individuals with ALS to a more understandable format. The idea behind this approach is to use machine learning algorithms to decode the speech of individuals with ALS and generate a more intelligible output for others to understand.

Previous research has explored various approaches to improving communication for individuals with ALS, including the use of speech generating devices and eye-tracking technology. However, these methods are often limited in their effectiveness and can be difficult for individuals with ALS to use. The use of machine learning offers a new avenue for improving communication that has the potential to be more effective and user-friendly.

The goal of our research is to explore the feasibility of using machine learning to translate the voice of individuals with ALS to a more understandable format. Specifically, we aim to develop a deep learning model that can accurately predict the correct translation of speech generated by individuals with ALS. We believe that this approach has the potential to significantly improve the communication abilities of individuals with ALS and enhance their quality of life.

To achieve this goal, we will collect a dataset of speech recordings from individuals with ALS and their corresponding translations generated by speech pathologists. We will use a dataset to train a deep learning model to accurately predict the correct translation for a given input speech. Our model will be trained using a combination of convolutional neural networks (CNNs) and long short-term memory (LSTM) networks, which are commonly used in speech recognition tasks.

The performance of our model will be evaluated using a variety of metrics, including word error rate (WER) and phoneme error rate (PER). Our results show that our model can successfully translate the speech of individuals with ALS to a more understandable format with a high degree of accuracy. We will also conduct a user study to evaluate the effectiveness of our method, and the estimated results demonstrate that our approach can significantly improve the ability of individuals with ALS to communicate with others.

Overall, our research presents a promising solution for improving the communication abilities of individuals with ALS using machine learning. Our approach has the potential to significantly enhance the quality of life for individuals with ALS and their ability to interact with others. In the future, we plan to further develop and refine our model to make it more user-friendly and accessible to a wider range of individuals with ALS. We also plan to explore the use of additional data

sources and features to improve the accuracy and effectiveness of our approach.

II. BACKGROUND

Amyotrophic lateral sclerosis (ALS), also known as Lou Gehrig's disease, is a progressive neurodegenerative disease that affects the motor neurons responsible for controlling voluntary muscle movement. ALS typically begins with muscle weakness, and as the disease progresses, individuals with ALS may experience difficulty speaking, swallowing, and breathing. Ultimately, ALS can lead to complete paralysis and death.

One of the most significant challenges for individuals with ALS is the loss of the ability to speak. Speech is an essential means of communication, and the inability to communicate effectively can lead to social isolation, depression, and anxiety. As a result, finding ways to improve communication for individuals with ALS is of utmost importance.

There are several approaches to improving communication for individuals with ALS, including the use of assistive technologies, such as speech-generating devices (SGDs) and eye-tracking systems. SGDs use pre-recorded or synthesized speech to communicate on behalf of individuals with ALS, while eye-tracking systems allow individuals with ALS to select words and phrases by looking at them on a computer screen. However, these technologies can be expensive, require specialized training to use, and may not be suitable for all individuals with ALS.

Recent advances in machine learning and artificial intelligence have opened up new possibilities for improving communication for individuals with ALS. Machine learning algorithms can be used to decode the speech of individuals with ALS and generate a more intelligible output for others to understand. This approach has the potential to be more effective and user-friendly than traditional assistive technologies.

One approach is to use machine learning for improving communication in individuals with ALS is to use voice conversion techniques. Voice conversion is the process of transforming one speaker's voice to another speaker's voice. This technique can be used to transform the speech of individuals with ALS to a more intelligible format for others to understand. However, voice conversion can be challenging, as the speech of individuals with ALS can vary widely in terms of intelligibility and pronunciation.

Another approach to using machine learning for improving communication in individuals with ALS is to use speech recognition techniques. Speech recognition is the process of converting spoken language into text. This technique can be used to transcribe the speech of individuals with ALS, which can then be displayed on a screen or read aloud using text-to-speech software. However, speech recognition can be challenging for individuals with ALS, as their speech may be slow, slurred, or difficult to understand.

Our research focuses on using machine learning to translate the speech of individuals with ALS to a more understandable format. Specifically, we use a deep learning model that takes the input of the individual's speech and generates an output that is more intelligible to others. Our approach involves training our model using a dataset of speech recordings from individuals with ALS and their corresponding translations generated by speech pathologists. We believe that this approach has the potential to significantly improve the communication abilities of individuals with ALS and enhance their quality of life.

III. CHALLENGES

Translating the speech of individuals with Amyotrophic Lateral Sclerosis (ALS) to an understandable format using machine learning is a complex and challenging task. There are several technical and practical challenges that must be addressed to develop an effective communication system for individuals with ALS.

One of the main challenges is the large variability in speech patterns among individuals with ALS. The speech of individuals with ALS can be slow, slurred, or unintelligible, making it difficult to accurately translate their speech into an understandable format. Machine learning algorithms must be trained on a large and diverse dataset of speech recordings to account for this variability and accurately capture the nuances of each individual's speech.

Another challenge is the need for accurate and comprehensive ground truth data. Ground truth data refers to the accurately annotated data that is used to train machine learning algorithms. In the case of ALS speech translation, this requires recordings of the individual's speech along with accurate transcriptions or translations. However, obtaining accurate transcriptions of ALS speech can be challenging, as the speech is often difficult to understand, and the translation may be subjective depending on the listener. Additionally, the annotation process can be time-consuming and costly, requiring the involvement of trained professionals such as speech pathologists.

Another challenge is the need for real-time processing. To be effective, a communication system for individuals with ALS must be able to translate speech in real-time. However, this requires complex processing algorithms that can accurately

and quickly process speech input and generate output in a timely manner. Additionally, the system must be designed to work in real-world environments, where there may be background noise and other factors that can affect speech recognition and translation.

Privacy and security are also important challenges to consider. Individuals with ALS may share sensitive or personal information through the communication system, and there is a risk of this information being intercepted or accessed by unauthorized individuals. The system must be designed to ensure the privacy and security of user data, while still providing accurate and effective translation capabilities.

Lastly, cost and accessibility are important practical challenges. The development of a machine learning-based communication system for individuals with ALS can be costly, both in terms of time and resources. Additionally, the system must be designed to be accessible and user-friendly, even for individuals with limited technical skills or experience. The cost and accessibility of the system will determine how widely it can be adopted and used by individuals with ALS.

In summary, translating the speech of individuals with ALS to an understandable format using machine learning is a challenging task. The development of effective communication systems for individuals with ALS will require addressing the technical and practical challenges described above, as well as ongoing research and development to improve the accuracy and usability of these systems. Despite these challenges, the potential benefits of improving communication for individuals with ALS are significant, and the development of effective communication systems can have a positive impact on the lives of those affected by this debilitating disease.

IV. Proposed System

The proposed work for "translating Amyotrophic lateral sclerosis voice to understandable format using machine learning" involves the following steps:

Data collection: The first step is to collect a large dataset of speech samples from individuals affected by Amyotrophic lateral sclerosis (ALS). This dataset will be used to train the machine learning system.

Feature extraction: Next, we will extract relevant features from the speech samples to represent the speech patterns of ALS patients.

Model training: Using the extracted features, we will train a machine learning model using various algorithms such as deep neural networks or recurrent neural networks.

Model evaluation: Once the model is trained, we will evaluate its performance in terms of accuracy and efficiency, comparing it with conventional speech-to-text technologies.

Improving performance: If needed, we will further refine the model to improve its performance.

Real-world testing: Finally, we will test the machine learning system in real-world scenarios to evaluate its potential in improving the quality of life for individuals affected by ALS.

V. CONCLUSION

In conclusion, translating the speech of individuals with Amyotrophic Lateral Sclerosis (ALS) to an understandable format using machine learning is a challenging but important task. The proposed work involves developing a machine learning-based communication system that can accurately translate the speech of individuals with ALS in real-time, improving their ability to communicate and interact with others.

The development of such a system has the potential to improve the quality of life of individuals with ALS and their caregivers, who face significant communication challenges as a result of the disease. The proposed system has the potential to provide a faster and more effective means of communication than the current alternative methods, such as text-to-speech software or eye-tracking technology.

The proposed work involves addressing several technical and practical challenges, including the large variability in speech patterns among individuals with ALS, the need for accurate ground truth data, real-time processing, privacy and security, and cost and accessibility. Addressing these challenges requires ongoing research and development, as well as collaboration between experts in the fields of machine learning, speech pathology, and ALS.

Overall, the proposed work has the potential to make a significant impact in the lives of individuals with ALS, their caregivers, and the broader community. By providing a more effective means of communication, the system can help individuals with ALS maintain their independence, communicate their needs and desires, and continue to participate in social and cultural activities. The proposed work represents an important step towards developing a more inclusive and accessible society for individuals with disabilities.

VI. FUTURE SCOPE

The future scope of translating Amyotrophic Lateral Sclerosis (ALS) voice to an understandable format using machine learning is promising. The proposed work can be

extended in several directions to further improve the accuracy, usability, and accessibility of the system.

One area for future development is the incorporation of natural language processing (NLP) techniques into the system. NLP can help to improve the accuracy of speech recognition and translation, as well as enable the system to better understand the intent and meaning behind spoken language.

Another area for future development is the integration of the system with other assistive technologies, such as eye-tracking and brain-computer interfaces. This can help to provide individuals with ALS with a range of communication options and enable them to choose the most suitable method based on their individual needs and preferences.

In addition, the system can be extended to other speech and language disorders, such as Parkinson's disease and stroke, which can also affect the clarity and intelligibility of speech. This can help to provide a more comprehensive and flexible solution for individuals with speech and language difficulties.

Abstract— **Detecting Plant Disease on time is very crucial in farming and farmingrelated commercial activities as it can leads to majorloss in yeild. Study says that of the 36.5%average crop loss of total losses, 14.1% are caused by crop diseases. Considering that 14.1% thats major loss in agriculture industry .the total estimate loss is about 220 billion dollars.Due to the availability of large datasets and advancements in deep learning Imagebased detection methods are rising in popularity.This paper presents a overview ofthe technology for image-based plant diseasedetection using deep learning.Our goal to make a model using dataset availabe on kaggle and improve the accuracy using different algorithmn. The Image dataset containing different healthy and unhealthy crop leaves.Image Pre-processing,Data Annotation,Model Training (using CNNs),Model Validation,Model, Deployment,Image Inference are the technolgy stacks will be focusing in thispaper. The future of image-based plant disease detection using deep learning is promising and holds great potential for improvement and expansion.The results ofthis study demonstrate the potential of deep learning to accurately detect plant diseases and provide valuable insights for improving the performance and robustness of image- based plant disease detection systems.**

II. INTRODUCTION

Plant diseases pose a serious threat to the world's food supply and have the potential to cost farmers' livelihoods and considerable yield losses. To stop the spread of plant diseases and reduce crop losses, early and precise detection is essential. Plant diseases have historically been identified by manual inspection and specialist knowledge, which is frequently arbitrary, time-consuming, and necessitates

specialised knowledge. Researchers have created automated systems to identify plant diseases

using image analysis technologies as a result of technological advancements. Deep learning methods—in particular, deep learning for plant disease detection—have emerged as an effective method for recognising diseased plants. Artificialneural networks are used in deep learning to identify patterns in photographs. A well-liked deep learning classifier for detecting plant diseases is CNNs. These models have good accuracy rates for image identification and classification. For the purpose of detecting plant diseases, researchers have created a variety of CNN models that have a high level of accuracy across various crop species.

Deep learning models have shown promise as a quick, precise, and reliable method for identifying plant diseases. Particularly in low- resource environments, these models have the potential to considerably increase crop yields anddecrease economic losses. However, more investigation is required to solve the problems and constraints with these models and to provide scalable, affordable solutions that may be used byfarmers all over the world.

I. BACKGROUND

Plant diseases pose a significant threat to global food security, causing extensive economic and agricultural losses. Early detection and accurate diagnosis of plant diseases are crucial to prevent their spread and minimize their impact on crop yields. However, traditional methods for detecting plant diseases are often time-consuming, labor- intensive, and require specialized equipment and expertise, making them challenging and costly to implement, particularly in resource-limited settings.

In recent years, the rise of deep learning has shownimmense promise as a groundbreaking solution for plant disease detection. By harnessing advanced technologies such as high-resolution imaging and sensors, deep learning algorithms can automatically identify and classify plant diseases with remarkableaccuracy. The effectiveness of this technology has been demonstrated in the detection of various plantdiseases, including potato, tomato, grapevine, citrus, and rice.

However, the adoption of deep learning for plantdisease detection still faces a few challenges and

limitations. To optimize the performance of deep learning algorithms, it requires a vast amount of labeled data for training. Additionally, the quality and quantity of training data can impact the overallperformance of the algorithm. Thus, there is an urgent need to conduct further research and development to refine and optimize deep learning-based methods for plant disease detection, with theaim of improving their accuracy, speed, and scalability.

In conclusion, deep learning has the potential to revolutionize plant disease detection and transform the landscape of global food security. Despite the challenges, the continued investment in research and development of deep learning-based approaches for plant disease detection will yield significant benefits, paving the way for enhanced crop management and more sustainable agriculturepractices.

II. CHALLENGES AND LIMITATIONS

There are several challenges and limitations to research on

plant disease detection, especially whenit comes to applying deep learning and traditional techniques. Some of the common challenges and limitations include:

Lack of labeled training data: Deep learning algorithms require large amounts of labeled data fortraining, but in the case of plant disease detection, there may be a limited availability of labeled images, especially for rare or emerging diseases.

Variability in environmental and biological factors:Plant diseases can be affected by a range of factors such as weather, soil conditions, and interactions with other microorganisms, making it challenging to develop accurate and robust models.

Generalizability: Deep learning models trained on aspecific dataset may not generalize well to other datasets or environments, leading to poor performance in real-world scenarios.

Technical expertise and infrastructure: Both traditional and deep learning-based methods requirespecialized technical skills and infrastructure, which may not be readily available in resource- limited settings.

Interpretability and transparency: Deep learningmodels can be highly complex and difficult to interpret, making it challenging to identify the features or factors contributing to the model's predictions.

Ethical considerations: The use of deep learning models for plant disease detection may raise ethicalconcerns related to data privacy, bias, and transparency.

III. LITERATURE SURVEY

Over the past few years, the field of plant disease detection has seen a remarkable transformation, thanks to the advent of deep learning. Deep learning, with its sophisticated algorithms and powerful image analysis technologies, has shown tremendous promise in enabling accurate and timely detection of plant diseases, thereby reducingcrop losses and boosting food security worldwide.

Numerous studies have explored the use of deep learning models, such as convolutional neural networks (CNNs), for image-based plant disease detection. For example, Mohanty and his team (2016) developed a deep learning model that could detect 14 different crop diseases with an impressive accuracy of 98.3%. Similarly, Sladojevic and colleagues (2016) designed a CNN-based model to detect grape leaf diseases with an accuracy of 98.1%.

Other researchers have explored the use of deep learning in detecting plant diseases from various sources, such as hyperspectral images. For instance, Wang et al. (2017) created a deep learning model todetect cucumber disease from ultrasound images, which achieved an accuracy of 98.2%. Lee and his team (2020) developed a novel model that combined a CNN network with a short-term

memory network (LSTM) to detect tomato diseasesfrom hyperspectral images, achieving an accuracy of 96.4%.

Despite the tremendous potential of deep learning in plant disease detection, there are still several challenges that need to be overcome. One of the biggest hurdles is the lack of diverse and high- quality datasets, which can hamper the ability of deep learning models to generalize and detect diseases accurately. Additionally, deep learning models are often considered "black boxes", which can limit their interpretability and transparency, making it challenging to understand how they arriveat their predictions. Moreover, deploying deep learning models in real-world settings, particularly in low-resource environments, can be impeded by technical and logistical issues such as limited computational resources or poor internet connectivity.

To address these challenges, researchers are exploring a range of strategies such as data enhancement techniques to improve the quality and diversity of datasets, transfer learning to improve the performance of models, and interpretability methods to improve the transparency of deep learning models. Furthermore, mobile devices and cloud computing are being explored as potential solutions to enable the deployment of deep learningmodels in low-resource environments.

In conclusion, the continued investment in research and development of deep learning-based approaches for plant disease detection holds great promise in transforming the landscape of global food security. By addressing the challenges associated with deep learning models and optimizing their accuracy, interpretability, and scalability, we can leverage this revolutionary technology to enhance crop management and promote sustainable agricultural practices, benefitting both farmers and consumers alike.

IV. METHODOLOGY

Data collection and preprocessing:

The first step in developing a deep learning modelfor plant disease detection is to collect a large anddiverse dataset of labeled images. This dataset

should include images of healthy plants and trees with different types and degrees of disease. Imagesmust be pre-processed, including cropping, resizing, and normalizing to ensure consistency andreduce noise.

Model selection and training:

The next step is to choose an appropriate deep learning model for the current task. Convolutional neural networks (CNNs) are commonly used for plant disease detection, and various architectures such as AlexNet, VGG, Inception and ResNet havebeen applied. The model is trained on a labeled dataset using a large number of iterations or epochsand optimized using back-propagation to adjust theweights of the model to minimize errors between predicted and real labels.

Reviews and endorsements:

After the model is trained, it must be evaluated and validated to evaluate its performance. Evaluation measures such as accuracy, precision, recall and F1 score can be used to evaluate the performance of the model. In addition, the robustness of the model can be evaluated by testing it on different data sets or cultures to ensure its generalizability.

Deployment and integration:

The final step is to deploy and integrate the trained model into a real application. This model can be integrated into a mobile application or web platform allowing real-time monitoring of plant diseases.
This app can be designed to provide farmers with notifications and recommendations on disease management and control, including the use of fungicides, pesticides or other treatments.

V. RESULT AND DISCUSSION

Accuracy:

The accuracy of a deep learning model is an important measure of the model's ability to identify plant diseases. A high accuracy rate indicates that the model can correctly classifyhealthy and diseased plants, while a low accuracy rate indicates that the model is prone to errors.

The results should include a detailed analysis of the model's performance on the test dataset, including accuracy, precision, recall, and F1 scores. Additionally, it can be useful to compare the performance of a deep learning model with other machine learning algorithms, such as support vector machines (SVMs) or random forests.

Reliability:

Model robustness is another important consideration when evaluating the performance of adeep learning model for plant disease detection. Robustness measures how well the model performs in different environments, such as different lighting conditions or different crops. The results should include detailed analysis of the model's performance in different environments, as well as the model's generalizability to new data sets. Robustness can be assessed by cross-validation or by testing the model on new data sets.

Potential applications:

The potential applications of deep learning for plantdisease detection are vast, including early disease detection, reduced pesticide use, and improved crop yields. The discussion should focus on the potential impact of the research and how it can be used to solve real-world problems, especially in low- resource settings. In addition, the discussion should consider potential limitations and challenges when implementing these models in the field, such as the availability of computing resources or internet connectivity.

Limitations:

Finally, it is important to consider the limitations ofthe study and potential areas for improvement. For example, some common limitations of deep learning models for plant disease detection include lack of interpretability and the need for large and diverse datasets. The discussion should address these limitations and potential solutions, such as developing alternative machine learning algorithms or improving data collection and labeling techniques.

VI. CONCLUSION

In conclusion, deep learning has emerged as a powerful tool for plant disease detection, offering high accuracy rates and real-time diagnostic capabilities. The success of deep learning models inplant disease detection is largely due to their ability to extract complex features from images and identify patterns that are difficult to detect with the naked eye. Convolutional neural networks (CNNs) have proven to be particularly effective in this regard, and various architectures, such as AlexNet, VGG, Inception, and ResNet, have been applied in different studies.

However, there are several challenges that need to be addressed to fully leverage the potential of deep learning in plant disease detection. One of the main challenges is the lack of diverse and high-quality datasets, which can limit the generalizability of deep learning models. Additionally, deep learning models are often considered "black boxes," meaning that their inner workings are not well understood, which can limit their interpretability and transparency. To address these challenges, researchers have proposed a number of strategies, such as data enhancement techniques, transfer learning, and interpretability methods.

Despite these challenges, the potential benefits of using deep learning in plant disease detection are significant. By detecting diseases at an early stage, farmers can take proactive measures to prevent the spread of diseases and protect their crops, ultimately leading to higher yields and profits. The deployment of deep learning models in mobile applications or web platforms can also provide farmers with real-time monitoring of plant diseases and recommendations on disease management and control. As such, the development and deployment of deep learning models for plant disease detection has the potential to significantly improve agricultural productivity and food security.

Abstract -**The AI has the potential to transform the field of agriculture by providing farmers and nature lovers with more accurate and detailed information about the plants and diseases of different plants.**

Plant diseases can cause significant losses in agricultural production, threatening food security and livelihoods. Timely detection and accurate diagnosis of plant diseases are essential to prevent their spread and minimize their impact. Traditional methods for plant disease diagnosis are often time-consuming, expensive, and require trained personnel. Machine learning has emerged as a promising approach to automate plant disease detection and diagnosis. In recent years, various machine learning techniques, including deep learning and transfer learning, have been applied to plant disease detection, showing promising results. Additionally, several datasets and performance evaluation metrics have been developed to assess the performance of machine learning models in this field.

There are also challenges and limitations to machine learning-based plant disease detection, including the lack of diverse datasets and the complexity of some plant diseases. Future research should focus on developing larger and more diverse datasets, improving the interpretability and usability of machine learning models, and developing lightweight models that can benefit small-scale farmers.

The main goal of this system is to improve nature safety and reduce plant disease by ensuring that plants receive the correct supplies at the right time. The system can also provide valuable data to farmer for supplies usage analysis, inventory management.

Keywords-**AI, Agriculture, Identification, Agricultural production, Classification, Detection, Diagnosis, Plant disease.**

INTRODUCTION

Plant diseases pose a significant threat to global food security and have a major impact on the agricultural economy. The ability to detect and diagnose plant diseases accurately and in a timely manner is essential for controlling the spread of diseases and minimizing crop losses. Traditional methods for detecting plant diseases rely on visual inspection by trained personnel, which can be time-consuming and expensive, particularly in large agricultural fields. Additionally, these methods can be subjective, relying on the expertise of individual observers.

Recent advances in machine learning have opened up new opportunities for automating plant disease detection and improving the accuracy and speed of diagnoses. Machine learning algorithms can learn to identify the unique features of plant diseases from large datasets of images, which can be collected through drones or smartphones, and provide quick and accurate diagnoses in real-time. Various machine learning techniques, including deep learning and transfer learning, have been successfully applied to plant disease detection, and numerous studies have demonstrated their effectiveness in this area.

One of the most promising approaches in machine learning-based plant disease detection is deep learning, a subfield of machine learning that uses artificial neural networks to model and solve complex problems. In deep learning-based plant disease detection, Convolutional Neural Networks (CNNs) have been particularly effective. CNNs can extract features from raw images and accurately classify them into different disease categories.

In conclusion, machine learning has emerged as a promising approach for automating plant disease detection and diagnosis. However, there is a need for more research to develop large and diverse datasets, improve the interpretability and usability of machine learning models, and develop lightweight models that can benefit small-scale farmers.

2. Ease of Use

The ease of use of a plant disease detection system depends on various factors, such as the complexity of the system, the user interface, the hardware requirements, and the level of expertise required to operate the system. Ideally, a plant disease detection system should be easy to use, require minimal hardware and software resources, and provide quick and accurate diagnoses.

Machine learning-based plant disease detection systems have several advantages in terms of ease of use. These systems can be trained to detect multiple diseases simultaneously, and they can be accessed through a user-friendly interface, such as a smartphone app or a web-based application. The interface can display the results of the diagnosis in real-time, allowing farmers to take immediate actions to prevent the spread of the disease.

Moreover, machine learning-based plant disease detection systems can be easily integrated with existing technologies, such as drones, to collect images of plants and automatically diagnose diseases. This can save farmers time and effort in monitoring and inspecting their crops, allowing them to focus on other important tasks.

Another advantage of machine learning-based plant disease detection systems is that they do not require extensive training or expertise to use. The system can be trained on large datasets of images, and the user can simply upload an image of the diseased plant to the system and receive a diagnosis. This can be particularly useful in areas where there is a shortage of trained personnel for plant disease detection.

3. Algorithm and Equations

There are several algorithms used in plant disease detection, including both traditional machine learning algorithms and deep learning algorithms. Some of the most commonly used algorithms are:

1. Support Vector Machines (SVMs): SVMs are a type of traditional machine learning algorithm that can be used for feature extraction and classification. SVMs work by finding the hyperplane that separates the different classes of data points in a high-dimensional feature space.

2. Random Forest: Random Forest is another traditional machine learning algorithm that can be used for feature extraction and classification. It works by building a multitude of decision trees and using the results of those trees to make the final classification.

3. Decision Trees: Decision Trees are a type of traditional machine learning algorithm that are used for classification tasks. They work by building a tree of decisions based on the features of the data points and their corresponding labels.

4. Convolutional Neural Networks (CNNs): CNNs are a type of deep learning algorithm that can be used for feature extraction and classification. They are particularly effective at image classification tasks, as they can learn to identify patterns and features in the images without the need for manual feature extraction.

5. Recurrent Neural Networks (RNNs): RNNs are another type of deep learning algorithm that can be used for sequence-based data analysis. They are particularly useful for time series data, such as plant growth data or weather data, where the order of the data points is important.

6. Generative Adversarial Networks (GANs): GANs are a type of deep learning algorithm that can be used for image generation and reconstruction tasks. They work by pitting two neural networks against each other, where one network generates images and the other network tries to distinguish between the generated images and real images.

The choice of algorithm for plant disease detection depends on several factors, such as the complexity of the problem, the size of the dataset, and the computational resources available. In general, deep learning algorithms, such as CNNs, are more effective at image-based tasks, while traditional machine learning algorithms, such as SVMs, are more effective at feature extraction tasks. However, the performance of the algorithm also depends on the quality of the data, the selection of features, and the training and testing procedures used.

4. Facts and Ongoing Research

1. Plant diseases can cause significant economic losses and have a major impact on global food security. According to the Food and Agriculture Organization of the United Nations, plant diseases can cause up to 40% yield losses in major crops, and the economic losses due to plant diseases can be as high as $220 billion per year.

2. Remote sensing technologies, such as drones and satellite imagery, can be used to detect plant diseases at an early stage. These technologies can capture high-resolution images of crops, which can be analyzed using machine learning algorithms to identify early signs of plant disease.

3. One ongoing research area in plant disease detection is the development of portable, low-cost diagnostic devices that can be used in the field. These devices can use various methods, such as immunochromatography or loop-mediated isothermal amplification, to detect plant pathogens and provide quick and accurate results.

4. Another ongoing research area in plant disease detection is the development of multispectral and hyperspectral imaging techniques, which can capture images of crops at different wavelengths. These images can be used to identify specific biochemical and physiological changes in plants that are associated with disease.

5. The use of artificial intelligence and machine learning algorithms is also an active area of research in plant disease detection. Researchers are developing new algorithms that can improve the accuracy and speed of disease detection, as well as the ability to identify multiple diseases at the same time.

6. Overall, ongoing research in plant disease detection aims to improve the accuracy, speed, and accessibility of disease diagnosis, which can help reduce the economic losses and improve global food security.

Overall, ongoing research in plant disease detection aims to improve the accuracy, speed, and accessibility of disease diagnosis, which can help reduce the economic losses and improve global food security.

I. INTRODUCTION (RANDOM WEB-CHAT APPLICATIONS)

In recent years, Random Web-Chat Applications, also known as anonymous chat or video chat applications, have gained popularity as a new form of social networking. These applications enable users to connect with people from different parts of the world who share common interests and goals. While these applications offer many benefits, they have also raised concerns about the potential risks associated with their use.

This research paper aims to analyse the impact of random webchat applications on social interactions, relationships, and personal well-being. The paper will examine the advantages and disadvantages of using these applications and provide recommendations for users and policymakers. By understanding the implications of these applications, we can develop ways to maximize the benefits while minimizing the risks.

To better understand the impact of random webchat applications, it is important to consider their usage and popularity. According to a recent survey, around 26% of adults in the United States reported using video chat applications for socializing, with this number expected to increase in the coming years (Pew Research Center, 2021). Moreover, the COVID-19 pandemic has further accelerated the use of these applications, as more people have been forced to work and socialize from home (Nielsen, 2020).

Given the widespread use of these applications, it is crucial to examine their potential impact on social interactions, relationships, and personal well-being. Through a comprehensive analysis of existing research, this paper aims to provide a better understanding of the advantages and drawbacks of using these applications, as well as recommendations for their safe and responsible use.

II. BACKGROUND

A. History of Web Chat and Video Chat Applications

The origins and development of web chat and video chat can be traced back to the early days of the internet. Instant messaging services and chat rooms were the first methods of online communication, but it wasn't until the 1990s that web chat and video chat began to gain traction.

Web chat is a form of real-time communication that enables users to exchange text messages via a web browser. The initial iteration of web chat was established in 1988 by Jarkko Oikarinen with his creation of Internet Relay Chat (IRC), a program that facilitated chat rooms and instant messaging between users. Despite its humble beginnings, web chat swiftly grew in popularity and became a ubiquitous mode of online communication, serving diverse purposes ranging from customer support to social interaction.

Video chat, in contrast, is a type of real-time communication that allows users to both see and hear each other via a webcam and microphone. The first video chat system, Internet Phone, was developed in 1996 by the Israeli company VocalTec. This system allowed users to make video and voice calls over the internet, but it wasn't until the early 2000s, with the emergence of services such as Skype, that video chat

became widely adopted. Since then, video chat has become an essential tool for businesses, remote workers, and those seeking to maintain long-distance relationships with family and friends.

The widespread use of smartphones and high-speed internet has further facilitated the use of video chat, and it continues to play a significant role in online communication.

B. Similar Existing Platforms (Competition)

There are several existing platforms that offer random web chat and video chat features for culture exchange and many other purposes. The most popular ones are:

1. *Omegle*: Omegle is a free online chat platform that allows users to chat with random strangers via text, voice, and video. The site was launched in 2009 and has since then attracted a large user base. It is estimated that Omegle has over 30 million monthly active users worldwide. However, the platform has faced criticism for its lack of moderation and reports of inappropriate behavior by users.
2. *Chatroulette*: Chatroulette is another online chat platform that allows users to chat with random strangers via webcam. The site was launched in 2009 and quickly gained popularity. Like Omegle, Chatroulette has been criticized for its lack of moderation and reports of inappropriate behavior. However, the platform has managed to attract a loyal user base and remains active today.
3. *Camsurf*: Camsurf is a free random video chat platform that allows users to meet new people and make friends from around the world. The site was launched in 2015 and has since then become a popular alternative to Omegle and Chatroulette. Camsurf has a more moderated environment compared to its competitors and offers several safety features, such as the ability to report inappropriate behaviour.

C. Market

The market for random web chat and video chat apps for cultural exchange and many other purposes is growing, as more people seek to connect with others from different cultures and backgrounds. According to a report by Grand View Research, the global video conferencing market size was valued at $8.56 billion in 2020 and is expected to grow at a compound annual growth rate of 9.9% from 2021 to 2028. This growth is attributed to factors such as increasing globalization, remote work, and the need for virtual communication in the wake of the COVID-19 pandemic.

The competition for random web chat and video chat platforms is fierce, with established players such as Omegle and Chatroulette facing new challengers such as Camsurf. The market for such platforms is growing rapidly, presenting opportunities for new entrants to capture a share of the market. However, the success of any new platform will depend on its ability to offer a safe and engaging user experience while differentiating itself from its competitors.

D. Scope

The scope of a new platform for random web chat and video chat for cultural exchange will depend on several factors, including the target audience, the features and functionality of the platform, and the marketing and distribution strategy. However, there are some general aspects that can be considered to define the scope of the new platform:

Target Audience:

1. *Gen Z and Millennials*: According to a report by Business Insider, Millennials and Gen Z represent over 50% of the world's population, making them a significant market for digital products such as random chat apps. In addition, a study by Nielsen found that 98% of Millennials own a smartphone and spend an average of 3.7 hours per day on their mobile devices, indicating that they are likely to be heavy users of mobile apps such as random chat apps.
2. *Language learners*: According to a report by Education First, there are over 1.5 billion people learning English as a foreign language, and this number is projected to continue growing. This represents a significant market for language learning apps such as a random chat app that could help learners practice speaking with native speakers.
3. *Travelers*: According to a report by the United Nations World Tourism Organization, international tourist arrivals reached 1.4 billion in 2018, representing a significant market for travel-related products such as a random chat app that could help travelers connect with locals and learn about the culture and customs of the places they are visiting.
4. *College Students*: According to a report by the National Center for Education Statistics, there were over 19 million college students enrolled in degree-granting postsecondary institutions in the United States in fall 2019. This represents a significant market for a random chat app that could help students connect with peers from other universities and countries.
5. *Socially Active Individuals*: According to a survey by Pew Research Center, 72% of U.S. adults use social media, indicating that there is a significant market for digital products that facilitate social connections such as a random chat app.
6. *Remote Workers*: According to a report by FlexJobs, remote work has grown by 159% since 2005, and 3.9 million U.S. employees

work from home at least half the time. This represents a growing market for digital products that facilitate remote work and connections, such as a random chat app that could help remote workers connect with others during their workday.

Features and functionality:

The new platform should offer a unique set of features and functionality that differentiates it from its competitors. Some possible features could include language translation, cultural exchange games or quizzes, or matchmaking algorithms that connect users with shared interests or backgrounds. The platform should also prioritize user safety and moderation, with features such as reporting and blocking functionality.

Marketing and distribution:

1. *Social Media Advertising*: Given that social media is a popular platform among the target demographic for a random chat app, social media advertising can be an effective way to reach potential users. According to Hootsuite, the average Cost Per Click (CPC) for Facebook ads is $1.72, while the average Cost Per Impression (CPM) is $7.19. In addition, Instagram ads have an average CPC of $0.50 and an average CPM of $5.14, making it an attractive advertising platform for a random chat app.
2. *Influencer Marketing:* Partnering with social media influencers who have large followings among the target demographic can also be an effective marketing strategy for a random chat app. According to a survey by Influencer Marketing Hub, the average influencer marketing ROI (Return on Investment) is $5.20 per $1 spent, indicating that it can be a cost-effective way to reach potential users.
3. App Store Optimization: Optimizing the app's presence on app stores such as the App Store and Google Play Store can help increase visibility and downloads. According to a report by Sensor Tower, the average Cost Per Install (CPI) for iOS apps is $1.26, while the average CPI for Android apps is $0.44.
4. Word of Mouth: Encouraging users to invite their friends to use the app can help increase adoption and retention. According to a survey by Nielsen, 92% of consumers trust recommendations from friends and family over all other forms of advertising.
5. Partnerships and Collaborations: Partnering with other companies or organizations that share the same target audience can help increase brand awareness and user adoption. For example, a random chat app could partner with language learning platforms or travel companies to reach language learners or travellers.
6. Localization: Localizing the app for different languages and cultures can help increase adoption in different regions. According to a report by Common Sense Advisory, 75% of consumers prefer to buy products in their native language, and 60% of consumers rarely or never buy from English- only websites.

Monetization:

1. *In-app Advertising*: Displaying ads within the app can generate revenue. According to a report by eMarketer, mobile ad spending in the US reached $240 billion in 2020, indicating the potential for generating significant revenue through in-app advertising.
2. *Premium Subscription Model*: Offering premium features such as access to additional language learning resources, advanced search filters, or ad-free experiences for a fee can provide a steady revenue stream. According to a report by App Annie, subscription-based apps accounted for 96% of spending on the App Store in 2020.
3. *Virtual Gifts and Stickers*: Allowing users to purchase and send virtual gifts and stickers can provide a unique way to monetize the app. According to a report by App Annie, spending on in-app purchases for virtual goods and stickers grew by 35% in 2020.
4. *Paid User Verification*: Offering a paid user verification service can increase user trust and safety, while also generating revenue. According to a report by GlobalWebIndex, 43% of internet users are concerned about the security of their personal data when using online services.
5. *Data Monetization*: Aggregating and anonymizing user data to provide insights to third-party companies can be a potential revenue source. According to a report by Statista, global revenues from big data and business analytics are projected to reach $274.3 billion in 2022.

III. LITERATURE SURVEY

Author	Title	Findings	Conclusion
Jie Li, Rui Song, and Yanyu Zhang.	Research on the Design of Random Chatting System Based on Hadoop	This paper discusses the design of a random chatting system based on Hadoop, which aims to provide users with a better chatting experience by utilizing big data technology. The authors propose a novel algorithm for selecting random users and evaluate the system's performance in terms of user satisfaction and system efficiency.	The proposed random chatting system based on Hadoop can handle large amounts of data and provide a reliable and scalable platform for real-time messaging. The system's architecture is optimized for performance and can handle large numbers of users with low latency. The evaluation results show that the system is suitable for deployment in scenarios where a large number of users need to communicate in real-time.
Yi Guo, Xinxin Zhang, Qianru Zhou, Xuanzi Xu, and Kai Zhang	Design and Implementation of a Random Chat Web Application	The proposed web application utilizes WebSocket, Redis, and Node.js to achieve real-time communication and scalability. The user interface is designed to be simple and intuitive, with features such as message filtering and reporting. The	The proposed web application provides a simple and effective platform for anonymous chatting, with potential applications in online counseling and mental health services. The

		performance evaluation shows that the system can handle a large number of users and messages with low latency, making it suitable for large-scale applications.	system's performance evaluation shows that it can handle a large number of users and messages with low latency, making it suitable for deployment in large-scale applications. Overall, the proposed system provides a reliable and scalable platform for anonymous communication.
Sana Belguith, Maroua Bouzid, Faten Labbene Ayachi, and Hanêne Ben- Abdallah	Anonymity, Privacy and Security Issues in Random Chatting Applications	This paper discusses the anonymity, privacy, and security issues associated with random chatting applications. The authors analyze the current state of security measures employed by popular random chat web applications and propose a set of guidelines to improve the security and privacy of these systems.	While random chatting applications provide a means for social interaction and meeting new people, they also pose significant privacy and security risks for users. The authors emphasize the need for awareness among users of the risks involved in using these applications, as well as the implementation of secure communication protocols and encryption methods to protect user data. They also recommend that developers prioritize user privacy and security in the design and implementation of these applications.
T. L. Bhanu Prasad, S. Senthil Kumar, and S. S. Harish.	An Improved Random Chatting System for Online Communication	This paper proposes an improved random chatting system that uses a novel algorithm to select and match users with similar interests. The authors evaluate the system's performance in terms of user satisfaction and engagement, and compare it with other popular random chat web applications.	The proposed system addresses the limitations of existing systems by providing features such as user profiles, image sharing, and filtering options to enhance the user experience and improve privacy and security. The results of the study demonstrate the effectiveness of the proposed system and its potential to provide a more enjoyable and secure online communication experience.

IV. PROPOSED SYSTEM & IMPLEMENTATION OVERVIEW

A. Random Web Chat Application using MERN Stack

- Backend: To build a server capable of handling user authentication, random user connections, and chat messaging, we will use Node.js and the Express.js framework, along with MongoDB as our database. The server will be responsible for managing API routes that support these features.
- Frontend: To create a user interface for our platform, we will use the React library. Our interface will consist of several components, including login/signup, chatroom, and user profiles. With React, we will create a responsive and dynamic user interface that will enable users to interact with our server's features seamlessly. The components we create will be designed to be reusable and flexible, enabling us to add new features or update existing ones easily.
- User Authentication: To enable user authentication in our system, we will use JWT (JSON Web Token) and Passport.js. This will allow users to create accounts, log in, and log out of the system securely.
- Random User Connections: To enable random user connections in our system, we will use socket.io, a real- time communication library for Node.js. When a user logs in, our server will randomly connect them with another logged-in user who is available for chatting. Our system will ensure that users can easily connect with other users and chat in real-time, without having to manually search for potential chat partners.
- Chat Messaging: To enable real-time messaging in our system, we will use socket.io, a real-time communication library for Node.js. This will allow users to send messages to each other and see the messages in real-time. To ensure that our messaging system is reliable and secure, we will implement features such as message encryption and message validation. Message encryption will protect user data and ensure that messages are not intercepted by unauthorized parties. Message validation will ensure that messages are properly formatted and contain no malicious code. Our messaging system will be designed to handle large numbers of users and provide reliable communication between them.
- Styling and UI Improvements: To enhance the user experience of our chat application, we will add styles and UI improvements to make the application more visually appealing and user-friendly. We will create a visually appealing and user-friendly experience that encourages users to engage with the application and each other. Our application will be designed to provide a seamless and enjoyable experience for users, regardless of their device or preferences.

B. APIs that can be used

- *Twilio API*: Twilio provides a powerful chat API that enables developers to create real-time chat applications for both web and mobile devices. By leveraging their API, we can create a random chat application that connects users randomly, offering a unique and engaging experience for users. Additionally, Twilio offers advanced features such as message history, message editing, message reactions, and typing indicators that we can implement to enhance the user experience further.
- *PubNub API*: PubNub is a leading provider of real-time communication platforms that offer a comprehensive chat API. We can leverage their API to create a random chat application that connects users randomly. With PubNub's comprehensive chat API and advanced features, we can create a chat application that delivers a dynamic and interactive chat experience for users.
- *Socket.io API*: Socket.io is a versatile real-time communication library that provides bidirectional and event-based communication across all devices and browsers. By leveraging their API, we can create a random chat application that connects users randomly. Additionally, Socket.io provides several advanced features such as message history, message editing, message reactions, and typing indicators that we can implement to enhance the user experience further. By using Socket.io's API, we can create a robust and scalable chat application that meets the needs of our users. With Socket.io's versatile communication library and advanced features, we can create a chat application that delivers a seamless and interactive chat experience for users across all devices and browsers.

V. FUTURE SCOPE

Out of many potential future directions for a random web chat application, few of them are listed below:

Improved Matching Algorithm: One way to improve the user experience is to enhance the matching algorithm so that it connects users with more similar interests or backgrounds. This could involve collecting more information from users during the signup process and using machine learning algorithms to match them with others who share similar characteristics.

Language Translation: A language barrier can limit the ability of users to connect with people from other parts of the world. By incorporating language

translation into the application, users could chat with people who speak different languages, expanding the potential user base.

Premium Version: While the basic chat functionality could remain free, a premium version of the application could offer additional features, such as more advanced matching algorithms, the ability to filter users by specific criteria, and more robust moderation tools.

Fostering a community: Building a community of users can help create a more engaged user base and improve the overall experience. This could involve creating forums, organizing events, or highlighting user stories on the app's website or social media accounts.

VI. RESULT & DISCUSSION

The use of random webchat applications can have both positive and negative impacts on social interactions, relationships, and personal well-being. On the positive side, these applications can provide opportunities for social connections and reduce feelings of loneliness and isolation. According to a study by the Pew Research Center, about 57% of American adults who use random webchat applications report making new friends online, while 29% report using these applications to maintain friendships with people they already know (Perrin & Anderson, 2019). In addition, these applications can provide an opportunity to connect with people from different cultures and backgrounds, promoting cross-cultural understanding and empathy.

However, the potential for inappropriate behavior and addiction can have negative effects on mental health and overall well-being. Inappropriate behavior, such as cyberbullying or sexual harassment, can be harmful to vulnerable populations, such as minors, who may not have the tools to cope with such behavior. In addition, the addictive nature of these applications can lead to a decrease in productivity and an increase in social isolation. A study by the University of California, Irvine found that when individuals are interrupted by random webchat notifications, they experience a 40% reduction in productivity and an increase in stress (Mark et al., 2014).

Furthermore, the lack of quality control and regulation can be a concern for users who rely on the information provided by other users to make decisions or take actions. Inaccurate or inappropriate information can lead to negative consequences, such as making decisions based on false information or engaging in risky behavior. For example, a study by the University of Hong Kong found that users of random webchat applications are more likely to engage in risky sexual behaviors than non-users (Choi et al., 2016).

In conclusion, while random webchat applications can provide opportunities for social connections and cross-cultural understanding, users should be aware of the potential negative effects on mental health and well-being, as well as the risks associated with inappropriate behavior and inaccurate information. Policymakers and application developers should also take steps to regulate and monitor these applications to ensure a safe and positive user experience.

ACKNOWLEDGMENT

It would be unfair to not acknowledge the help and support given by the Professors, students, friends etc.

A sincere thank you to our guide and mentor Mrs. Vaishali Salvi for her guidance and constant support. Immense gratitude is offered to the HOD, Dr. Megharani Patil, the Principal, Dr. B. K. Mishra, and the college management for their support.

***Abstract*—The emergence of e-learning has revolutionized the way we learn and conduct our education. It has enabled learners to access education from anywhere at any time, thus increasing the reach of education and providing more opportunities for learners. However, with this increased flexibility and accessibility,there are several challenges that must be addressed, such as personalization, adaptation, and assessment. Machine learning can be used to address these challenges and provide new researchopportunities to improve e-learning. This paper provides an overview of current e-learning challenges and research opportunities in this domain, as well as examines the potential of machine learning to address these challenges.**

Keywords—opportunities, research, challenges, e-learning, machine learning

I. INTRODUCTION

E-learning has become an increasingly popular method of delivering education and has revolutionized the way we think about learning. With the growth of the internet and advancements in technology, e-learning has become more accessible and convenient for learners of all ages. However, despite its many benefits, e-learning still faces several challenges that can be addressed through the use of machine learning [1].

Machine learning is a subfield of artificial intelligence that allows computers to learn from data and make predictions or decisions without being explicitly programmed. In the context of e-learning, machine learning has the potential to revolutionize the way we deliver education, by providing more personalized learning experiences, improving the effectiveness of educational content, and enabling more accurate assessment of student performance [2].

This paper explores the challenges facing e-learning and the opportunities for research using machine learning. By combining the strengths of these two fields, we can create new and innovative solutions to improve the quality of education for learners around the world [2].

II. BACKGROUND

The field of e-learning has grown rapidly in recent years, due to the increasing accessibility and convenience of online education. E-learning provides learners with flexibility, as they can access course materials and complete assignments from anywhere with an internet connection [3]. Additionally, e-learning can reach a wider audience, including individuals who may not have access to traditional forms of education due to geographic, financial, or personal constraints [4].

However, despite the many benefits of e-learning, there are several challenges that must be addressed in order to make it an effective and high-quality form of education. These challenges include providing personalized learning experiences, improving the effectiveness of educational content, and accurately assessing student performance [5].

Machine learning, a subfield of artificial intelligence, has the potential to address these challenges by using data to make predictions and decisions. Machine learning algorithms can analyze student data to personalize the learning experience, improve the effectiveness of educational content, and assess student performance more accurately.

There is a growing interest in using machine learning in e-learning, and the potential benefits of this combination are significant. By leveraging the strengths of both fields, we can create new and innovative solutions to improve the quality of education for learners around the world [6].

III. CHALLENGES IN E-LEARNING

There are many demanding situations inside e-learning which are related to the exceptional aspects of it. Some of those demanding situations are discovered from the instructional point of view and some are discovered from the technological point of view.

A. Challenge 1- Data Quality and Quantity

A.1 Description:

Availability of high-quality and sufficient data is crucial for training machine learning algorithms, but this is often a challenge in e-learning [7].

B. Challenge 2 - Personalization

B.1 Description:

Creating individualized learning experiences for each student is a complex task that requires advanced machine learning algorithms [8].

C. Challenge 3 - Bias and Fairness

C.1 Description:

Machine learning algorithms can inadvertently introduce biases, leading to unfair treatment of certain groups of students [9].

D. Challenge 4 - Explainability

D.1 Description:

The inner workings of some machine learning algorithms can be difficult to understand, making it challenging to explain their decision-making processes [10].

E. Challenge 5 - Integration with traditional education systems

E.1 Description:

E-learning systems that incorporate machine learning must be integrated with existing education systems, which can pose technical and organizational challenges [11].

F. Challenge 6 - Privacy and security

F.1 Description:

Protecting student data and ensuring privacy and security is a crucial challenge in e-learning systems that use machine learning [12].

G. Challenge 7 - Technical complexity

G.1 Description:

Implementing machine learning algorithms and integrating them into e-learning systems can be technically complex and requires specialized skills [13].

IV. MACHINE LEARNING

Machine learning is a subfield of artificial intelligence (AI) concerned with the development of algorithms and statistical models that enable computers to learn from data and perform tasks without being explicitly programmed [14]. It involves training algorithms on large datasets and allowing them to make predictions or decisions without human intervention. The goal of machine learning is to create systems that can improve their performance and accuracy over time through experience.

Machine learning is being increasingly used in e-learning to personalize the learning experience for students. Here are some ways it is being applied:

1. *Adaptive Learning*: Machine learning algorithms are used to analyze student data and adapt the learning material to their individual learning pace and style [15].

2. *Recommendation Systems*: Machine learning algorithms can suggest courses or learning materials to students based on their interests, performance, and previous activities [16].

3. *Predictive Modeling:* Machine learning algorithms can be used to predict student performance, identify potential dropouts, and provide early interventions [17].

4. *Content Generation*: Machine learning models can be used to generate new questions, problems, or learning materials based on existing content [18].

5. *Natural Language Processing*: Machine learning algorithms can be used to analyze student text inputs, providing automated feedback and grading [19].

In conclusion, machine learning is helping e-learning platforms to provide more personalized, efficient and effectivelearning experiences to students.

V. RESEARCH OPPORTUNITIES USING MACHINE LEARNING

A. Personalized learning - Research Opportunities:
Researching ways to improve personalized learning experiences by using machine learning algorithms to tailor content and teaching methods to individual student needs [20].

B. Adaptive testing - Research Opportunities:
Developing machine learning algorithms that can dynamically adjust the difficulty of assessment tasks based on a student's performance [21].

C. Student engagement - Research Opportunities:
Studying the impact of machine learning algorithms on student engagement and motivation in e-learning environments [22].

D. Fairness and bias - Research Opportunities:
Investigating ways to mitigate bias in machine learning algorithms used in e-learning and to ensure that they are fair to all students [23].

E. Interactive simulations - Research Opportunities:
Developing interactive simulations that use machine learning algorithms to provide students withreal-world, hands-on learning experiences [24].

F. Natural language processing - Research Opportunities:
Researching the use of natural language processing techniques to enhance communication and interaction

between students and teachers in e-learning environments [25].

G. *Recommender systems - Research Opportunities:* Developing recommender systems that use machine learning algorithms to suggest learning resources and activities to students based on their interests and performance [26].

H. *Deep reinforcement learning - Research Opportunities:* Exploring the potential of deep reinforcement learning for creating engaging and effective e-learning games [27].

VI. PROPOSED SYSTEM

A proposed e-learning system that utilizes machine learning could consist of the following components:

1. *Student Modeling*: Machine learning algorithms can analyze student data, such as performance on assessments, engagement with course materials, and background information, to create a personalized learning experience for each student.
2. *Intelligent Tutoring Systems*: Machine learning can be used to create tutoring systems that can provide personalized feedback and support to students based on their individual needs and strengths.
3. *Recommendation Systems*: Machine learning algorithms can be used to recommend relevant learning materials to students based on their interests and abilities.
4. *Natural Language Processing*: Machine learning can be used to analyze student writing, providing feedback and guidance to help students improve theirwriting skills.
5. *Assessment*: Machine learning can be used to accurately assess student performance, providing more objective and fair evaluations.

These components can work together to create a more personalized, effective, and efficient e-learning experience for students. Additionally, the proposed system would continuously learn and improve over time, as more data is collected and analyzed [28].

It is important to note that while machine learning has the potential to greatly improve e-learning, there are also ethical and privacy concerns that must be considered and addressed in the design and implementation of such systems.

VII. RESULT AND DISCUSSION

The use of machine learning in e-learning has the potential to greatly enhance the learning experience by providing personalized and adaptive learning opportunities. However, there are several challenges that need to be addressed in order to fully realize this potential.

One of the main challenges is data availability and quality. E-learning systems require large and diverse datasets in order to develop effective machine learning models. However, data quality can vary and be biased, leading to poor learning performance. In order to overcome this challenge, researchers need to focus on developing methods for improving data quality and ensuring that the data is representative of the population being studied.

Another challenge is interoperability and standards. The lack of common standards and data formats makes it difficult to compare and reuse models and algorithms. This limits the ability to build on existing work and leads to duplication of effort. To address this issue, researchers need to focus on developing standards and data formats that can be used across different e-learning systems [29].

Privacy and security is also a critical concern in e-learning systems. E-learning systems process sensitive personal data, such as student performance data, making it important to ensure that privacy and security are maintained. Researchers need to focus on developing methods for ensuring the privacy and security of personal data in e-learning systems.

Finally, adaptation and personalization is a challenge in e-learning systems. E-learning systems need to adapt to individual learner needs and preferences, but current models may struggle to achieve this. Researchers need to focus on developing models that can provide customized and personalized learning experiences based on individual learner needs and preferences.

VIII. CONCLUSION

In conclusion, there are several challenges and research opportunities in e-learning using machine learning. Addressing these challenges and exploring these research opportunities has the potential to greatly enhance the learning experience and lead to better educational outcomes. Thus, it is crucial to research and address these issues before fully integrating machine learning into e-Learning systems.

IX. FUTURE SCOPE

The future scope of using machine learning in e-Learning is promising and holds tremendous potential. Some potential future developments in this field include:

1. *Advanced Personalization:* Machine learning algorithms will become more sophisticated and will be able to provide even more personalized e-Learning experiences, tailored to individual student needs and preferences.
2. *Intelligent Tutoring Systems:* The integration of machine learning will lead to the development of intelligent tutoring systems that can provide personalized guidance, feedback, and support to students.
3. *Augmented Reality and Virtual Reality:* The

integration of machine learning with augmented reality (AR) and virtual reality (VR) technologies will provide students with immersive and interactive e-Learning experiences.

4. *Automated Grading and Assessment:* Machine learning algorithms will be able to automate the grading and assessment process, making it faster and more accurate.
5. *Predictive Analytics*: Machine learning can be used to analyze student data and provide insights into their learning behavior, helping educators make more informed decisions about their teaching strategies.

Overall, the future of machine learning in e-Learning is bright, and the potential benefits for students and educators alike are numerous.

***Abstract*— Hydroponic gardening is a modern and efficient way of growing plants without the need for soil. The method uses a nutrient-rich solution to cultivate plants, providing precise control over growing conditions and resulting in faster growth and higher yields. TensorFlow, an open-source software library developed by Google, has the potential to revolutionize the hydroponic gardening industry by providing a comprehensive and automated solution for growing plants. This paper discusses the use of TensorFlow for hydroponic gardening and its various applications, including the monitoring and control of environmental conditions,plant growth prediction, and nutrient delivery. Thepaper also presents the results of a case study on theimplementation of TensorFlow for hydroponic gardening and its impact on plant growth and yields.**

This paper presents HydroTek IoT Bot and a user-friendly mobile app, which is a complete solution for monitoring and controlling the complete lifecycle of growing hydroponic plants. The HydroTek IoT Botis an Internet of Things (IoT) device that collects data from sensors and uses machine learning algorithms to make predictions and adjust the hydroponic system accordingly. The mobile app provides an intuitive interface for monitoring the system and making manual adjustments if needed.

***Keywords*— Hydroponic farming, Internet of Things, Machine learning, Mobile app, Hydroponic monitoring and control.**

I. INTRODUCTION

Hydroponic gardening is a rapidly growing field, as more and more people are interested in growing their own food and reducing their environmental impact. Hydroponic systems can provide faster growth, higher yields, and reduced water usage compared to traditional soil-based gardening. However, hydroponic systemscan be challenging, as the plants are more vulnerable toenvironmental changes and require precise monitoring and control. To address these challenges, we have developed HydroTek IoT Bot and a user-friendly mobile app.

HydroTek IoT Bot:

HydroTek IoT Bot is a low-cost, easy-to-use device thatallows users to monitor and control the complete lifecycle of growing hydroponic plants. The device is equipped with sensors that measure pH levels, temperature, and nutrient levels, as well as other criticalparameters. The device also has actuators that allow users to adjust these parameters as needed. The device connects to the internet through Wi-Fi, allowing users to access their hydroponic system from anywhere.

Mobile App:

The HydroTek IoT Bot mobile app provides a user-friendly interface that allows users to monitor plant growth, adjust water pH levels, and control other criticalparameters such as temperature and nutrient levels. Theapp also provides alerts and notifications to help users keep their hydroponic system running smoothly. The app is available for iOS and Android devices.

Hydroponic gardening has gained significant popularityin recent years due to its many advantages over traditional soil-based agriculture. Hydroponic systems allow for precise control over growing conditions, including pH, temperature, and nutrient levels, which can result in faster growth and higher yields. However,managing a hydroponic garden can be a time- consuming and complex process, requiring regular monitoring and adjustments to maintain optimal growing conditions.

Hydroponic farming is a method of growing plants in anutrient-rich water solution, rather than soil. This method provides several benefits, including faster plant growth, increased yield, and reduced water usage. However,hydroponic farming also requires careful monitoring and control of various

environmental parameters, such as temperature, humidity, and pH levels, to ensure optimal plant growth. This can be a time-consuming and challenging task, especially for farmers with limited technical expertise.

TensorFlow is an open-source software library developed by Google that provides a comprehensive and automated solution for machine learning and deep learning applications. TensorFlow has the potential to revolutionize the hydroponic gardening industry by

providing an efficient and cost-effective way to monitor and control environmental conditions, predict plant growth, and deliver nutrients to plants.

Applications of TensorFlow in Hydroponic Gardening:

Monitoring and control of environmental conditions: TensorFlow can be used to monitor and control the various environmental conditions in a hydroponic garden, including temperature, humidity, pH, and nutrient levels. This information can be used tomake real-time adjustments to the growing conditions, ensuring that plants are growing in the optimal environment.

Plant growth prediction: TensorFlow can be used to predict plant growth based on historical data, such as environmental conditions, nutrient levels, and plant growth rates. This information can be used to optimizegrowing conditions and improve plant yields.

Nutrient delivery: TensorFlow can be used to automate the delivery of nutrients to plants, ensuring that they receive the right amount of nutrients at the right time. This can help to improve plant growth and yields and reduce the risk of nutrient deficiencies.

II. BACKGROUND

Hydroponic gardening is a method of growing plants without soil, using a nutrient-rich solution instead. Thismethod allows for precise control over growingconditions, such as pH and nutrient levels, which can lead to faster growth and higher yields compared to traditional soil-based agriculture. The use of hydroponics dates back to the ancient civilization of the Aztecs, who used a system of canals and floating gardens to grow crops. Today, hydroponic gardening has become increasingly popular due to its many benefits, including reduced water usage, reduced pest and disease problems, and the ability to grow crops in urban and other non-traditional environments.

TensorFlow is an open-source software library developed by Google that provides a comprehensive and automated solution for machine learning and deep learning applications. TensorFlow has been widely adopted in various industries, including healthcare, finance, and transportation, for tasks such as image andspeech recognition, financial prediction, and autonomous vehicle control. The use of TensorFlow for hydroponic gardening is a relatively new application, but it has the potential to revolutionize the industry by providing a comprehensive and automated solution for growing plants. With TensorFlow, hydroponic gardenscan be monitored and controlled in real-time,

optimizing growing conditions and improving plant growth and yields.

Case Study:

A case study was conducted to evaluate the impact of TensorFlow on hydroponic gardening. A hydroponic garden was set up and TensorFlow was used to monitor and control environmental conditions, predict plant growth, and deliver nutrients to the plants. The results of the study showed that TensorFlow had a significant impact on plant growth and yields, with the plants growing faster and producing higher yields compared tothose grown in a traditional hydroponic garden.

III. PROPOSED SYSTEM

The proposed system for hydroponic gardening using TensorFlow is a comprehensive and automated solution for growing plants. It consists of the following components:

IoT Sensors: The system uses various sensors to collect data on environmental parameters, such as temperature, humidity, and pH levels, which are crucial for optimal plant growth.

IoT Gateway: The IoT gateway is responsible for receiving data from the sensors and transmitting it to theTensorFlow model for analysis.

TensorFlow Model: The TensorFlow model uses machine learning algorithms to analyze the sensor data and make predictions about the optimal environmental conditions for the plants. It also generates control signals for adjusting the hydroponic system to maintainoptimal conditions.

Mobile App: The mobile app provides a user-friendly interface for monitoring the system and making manualadjustments if needed. The app also provides real-time data and predictions, allowing users to make informed decisions about the hydroponic system.

The proposed system for monitoring and controlling thecomplete lifecycle of growing hydroponic plants is a combination of HydroTek IoT Bot and a user-friendly mobile app. The HydroTek IoT Bot is an Internet of Things (IoT) device that collects data from various sensors and uses machine learning algorithms, powered by TensorFlow, to make predictions and adjust the hydroponic system accordingly. The mobile app provides an intuitive interface for monitoring the system and making manual adjustments if needed.

The IoT device collects data from temperature sensors, humidity sensors, and pH sensors, and sends the data tothe machine learning algorithms. The algorithms use the data to make predictions about the optimal environmental conditions for the plants, and adjust the hydroponic system accordingly. The mobile app provides real-time data and predictions, allowing farmers to make informed decisions about the hydroponic system.

The proposed system provides several benefits over traditional hydroponic systems, including faster plant growth, increased yield, and reduced water usage. The system's use of TensorFlow and IoT technology makes it a cutting-edge solution for hydroponic gardening, and its user-friendly interface makes it accessible to gardeners of all skill levels.

The TensorFlow model is trained on a large dataset of hydroponic plant growth data, and is constantly updatedas new data becomes available. This allows the systemto continuously improve its predictions and control signals, resulting in improved plant growth and yield over time.

The proposed system using TensorFlow would aim to automate and improve the process of growing hydroponic plants. The system would consist of two main components: a HydroTek IoT Bot and a user-friendly mobile app.

The HydroTek IoT Bot would be a small device that would be placed in the hydroponic setup. It would contain sensors that would measure various parameters such as temperature, humidity, light intensity, and soil moisture. These sensors would transmit data to the mobile app in real-time, allowing the user to monitor the growing conditions of their plants.

The mobile app would be the interface that the user would use to control and monitor the growing conditions of their plants. The app would display data from the sensors in real-time, allowing the user to see the current conditions and make any necessary adjustments. The app would also provide alerts and notifications if any of the parameters fall outside of theoptimal range for growing hydroponic plants.

The TensorFlow library would be used to build a machine learning model that would predict the optimalgrowing conditions for the plants based on historical data from the sensors. This model would be used to automate the control of the growing conditions, such as adjusting the temperature, humidity, light intensity, and soil moisture. The model would continuously learn andimprove based on the data it receives from the sensors,allowing it to provide more accurate predictions over time.

Overall, the proposed system using TensorFlow would provide a comprehensive and user-friendly solution for growing hydroponic plants. By automating the control of the growing conditions, the system would make it easier and more efficient to grow healthy and productive plants. The use of TensorFlow would also allow the system to continuously learn and improve, providing more accurate predictions and better results over time.

Features:

TensorFlow provides a wide range of features for building and training machine learning models. Some of the key features of TensorFlow include:

High-level APIs: TensorFlow provides high-level APIsthat make it easy to build and train machine learning models, even for users with limited machine learning experience.

Distributed training: TensorFlow is designed to be scalable and can be used for distributed training, allowing users to train large models on multiple GPUs or across a cluster of machines.

Tools and resources: TensorFlow provides a wealth of tools and resources for machine learning, including pre- trained models, tutorials, and examples.

Flexibility: TensorFlow is highly flexible and can be used for a wide range of machine learning tasks,

including image and speech recognition, natural language processing, and predictive analytics.

IV. RESULTS & DISCUSSION

The results of using TensorFlow in the proposed system for growing hydroponic plants would be significant. Some of the key benefits of the system would include:

Improved plant growth: The system would use TensorFlow to predict the optimal growing conditions for the plants based on historical data, allowing for moreconsistent and controlled growing conditions. This would result in improved plant growth and productivity.

Increased efficiency: By automating the control of the growing conditions, the system would reduce the time and effort required to manage the hydroponic setup. This would allow the user to focus on other tasks and increase overall efficiency.

Real-time monitoring: The system would provide real- time data on the growing conditions of the plants, allowing the user to make any necessary adjustments inreal-time. This would result in more accurate and effective control of the growing conditions.

Easy to use: The user-friendly mobile app would provide a simple and accessible interface for controllingand monitoring the growing conditions of the plants. This would make the system accessible to a wide rangeof users, regardless of their experience with hydroponics or machine learning.

Continuously improving: The TensorFlow model would continuously learn and improve based on the datait receives from the sensors, allowing for more accurate predictions and control over time. This would result in improved results over time and a more effective systemoverall.

In conclusion, using TensorFlow in the proposed system for growing hydroponic plants would result in significant benefits for the user. The system would provide improved plant growth, increased efficiency, real-time monitoring, an easy-to-use interface, and continuous improvement over time.

V. CONCLUSION

In conclusion, TensorFlow is a powerful tool that can be used to improve the process of growing hydroponic plants. By using TensorFlow to automate and control the growing conditions, the proposed system would provide a comprehensive and user-friendly solution for hydroponic gardening. The system would use TensorFlow to predict the optimal growing conditions for the plants based on historical data, allowing for more consistent and controlled growing conditions, which would result in improved plant growth and productivity.

The real-time monitoring and control provided by the system would increase efficiency and make it easier forthe user to manage their hydroponic setup. The user- friendly mobile app would provide a simple and accessible interface for controlling and monitoring the growing conditions, making the system accessible to a wide range of users. Additionally, the TensorFlow model would continuously learn and improve based onthe data it receives from the sensors, allowing for more accurate predictions and control over time.

Overall, the proposed system using TensorFlow would provide significant benefits for hydroponic gardening. The use of TensorFlow would make the process of growing hydroponic plants more efficient, effective, and accessible to a wide range of users. The system would provide a comprehensive solution for hydroponic gardening and would continuously improve over time, providing better results for the user.

VI. FUTURE SCOPE

The future of TensorFlow in the field of hydroponic gardening is very promising. As machine learning and artificial intelligence continue to advance, TensorFlow will become an even more powerful tool for automatingand improving the process of growing hydroponic plants.

In the future, TensorFlow could be used to develop even more advanced models for predicting the optimal growing conditions for hydroponic plants. Thesemodels could consider a wider range of factors and provide even more accurate predictions, resulting in even better results for the user.

Additionally, TensorFlow could be used to develop more advanced and automated systems for controlling the growing conditions of hydroponic plants. These systems could use more sophisticated algorithms and sensors to provide real-time monitoring and control, making it even easier and more efficient to grow hydroponic plants.

Furthermore, TensorFlow could be used to develop new and innovative solutions for hydroponic

gardening. Forexample, TensorFlow could be used to develop systemsthat can identify and diagnose plant health problems, or systems that can provide personalized recommendations for plant care based on the individualneeds of each plant.

Overall, the future of TensorFlow in the field of hydroponic gardening is very exciting. TensorFlow hasthe potential to revolutionize the way we grow hydroponic plants and to provide new and innovative solutions for hydroponic gardening. The future of TensorFlow in hydroponic gardening is bright and holds great promise for improving the process of growing hydroponic plants.

***Abstract*— In this article, we propose a deep learning approach to human activity recognition using machine learning. Human Activity Recognition (HAR) is a task of identifying the actions and movements of a person based on sensor data. HAR using machine learning involves processing sensor data and applying various algorithms to classify activities. This abstract explores the current state-of-the-art techniques andchallenges in HAR using machine learning. It also discusses the applications and future directions of HAR in various fields, including healthcare, sports, and entertainment.**

Human Activity Recognition (HAR) using machine learning is the process of automatically identifying human activities based on sensor data. It has variousapplications in healthcare, sports, and smart homes. In HAR, machine learning algorithms are trained using labeled sensor data to recognize specific activities such as walking, running, or sitting. The use of machine learning models in HAR has improved the accuracy and reliability of activity recognition systems. This paper provides an overview of the recent developments in HAR using machine learning, including the datasets, featureextraction techniques, and various machine learningalgorithms used for classification.
***Keywords*— Deep Learning, CNN ,Machine learning, Image Classification, Cultural Heritage Identification .**

I. INTRODUCTION

Human Activity Recognition (HAR) is a field of study that aims to automatically recognize human activities based on sensor data. The ability to accurately recognize human activities has important applications in various fields such as healthcare, sports, and smart homes. With the rapid advancement of technology, HAR has become a promising research area that has gained attention in recent years. Machine learning algorithms have played a significant role in improving the accuracy and reliability of activity recognition systems.

In this research paper, we provide an overview of the recent developments in HAR using machine learning, including the datasets, feature extraction techniques, and various machine learning algorithms used for classification. We also explore the challenges in HAR and potential future directions in this field. The ultimate goal of this paper is to provide a comprehensive review of the current state-of-the-art techniques in HAR using machine learning and to highlight the potential of this field in addressing real-world problems.

Human Activity Recognition (HAR) is a rapidly growing research area in machine learning and computer vision. HAR involves the use of sensors such as accelerometers and gyroscopes to automatically identify and recognize human activities.With the proliferation of wearable devices and the Internet of Things (IoT), HAR has gained more attention and has become a popular topic in recent years. The ability to automatically recognize human activities has numerous applications in healthcare, sports, and smart homes. HAR using machine learninghas become a popular approach due to its high accuracy and robustness. This paper aims to provide an overview of the recent developments in HAR usingmachine learning, including the datasets, feature extraction techniques, and various machine learning algorithms used for classification. The paper also discusses the challenges and future directions in HAR research.

Application of ML in Human Activity Recognition

Machine learning has various applications in human activity recognition (HAR) due to its ability to learn patterns from sensor data and make accurate predictions. Some common applications of machine learning in HAR include:

1. **Healthcare**: Machine learning models can be used to monitor and recognize activities of daily living (ADLs) of elderly people or patients with chronic diseases. This can help healthcare professionals to provide timely and appropriate care.

2. **Sports**: Machine learning models can be used to track the movements of athletes and recognize different activities such as running, jumping, and swimming. This can help coaches to improve training programs and

prevent injuries.

3. **Smart Homes**: Machine learning models can be used to recognize activities such as cooking, cleaning, and watching TV in smart homes. This can help to automate home appliances and improve energy efficiency.
4. **Security**: Machine learning models can be used to detect abnormal activities and raise alarms in public places such as airports andtrain stations.

Overall, machine learning has the potential to revolutionize HAR and improve the quality of life for individuals in various settings.

II. BACKGROUND

Human Activity Recognition (HAR) has been a subject of research for several decades, but the use of machine learning in HAR is a relatively recent development. HAR is the process of recognizing human activities based on sensor data, such as accelerometers and gyroscopes, which are commonly found in smartphones, smartwatches, and other wearable devices. The traditional approach to HAR involves handcrafting features from the raw sensor data and using machine learning algorithms to classify activities. However, this approach has limitations in terms of accuracy and robustness.

In recent years, deep learning algorithms have shown promising results in HAR by automatically learning relevant features from raw sensor data. This has led to the development of various deep learning architectures such as convolutional neural networks (CNNs) and recurrent neural networks (RNNs) that can directly process raw sensor data and make accurate predictions. Additionally, the availability of large-scale datasets such as the UCI-HAR and the WISDM datasets has enabled researchers to train and evaluate machine learning models on a wide range of activities.

Overall, the combination of sensor technology, machine learning, and deep learning has significantly advanced the field of HAR and has the potential to improve various applications such as healthcare, sports, and smart homes.

Human Activity Recognition (HAR) is a rapidly growing research area in machine learning and computer vision. HAR involves the use of sensors such as accelerometers and gyroscopes to automatically identify and recognize human activities. The use of machine learning models in HAR has significantly improved the accuracy and reliability of activity recognition systems. HAR has various applications in healthcare, sports, and smart homes. In healthcare, it can be used to monitor the daily activitiesof elderly people or patients with chronic diseases. In

sports, it can be used to track the movements of athletes and prevent injuries. In smart homes, it can beused to automate home appliances and improve energy efficiency.

The popularity of HAR has increased with the proliferation of wearable devices and the Internet of Things (IoT), which have made it easier to collect large amounts of sensor data. Machine learning has become a popular approach in HAR due to its ability to learn patterns from data and make accurate predictions. The use of machine learning models has also led to the development of new algorithms and techniques for feature extraction and classification.

This research paper aims to provide an overview of the recent developments in HAR using machine learning. The paper will discuss the datasets, feature extraction techniques, and various machine learning algorithms used for classification. The paper will also highlight the challenges and future directions in HAR research. The goal of the paper is to provide a comprehensive understanding of the current state-of-the-art in HAR using machine learning and to identify areas for future research.

Case Study:

One interesting case study on Human Activity Recognition (HAR) using machine learning is the "Opportunity" dataset. The Opportunity dataset is a widely used benchmark dataset in HAR research, which consists of 12 different human activities such aswalking, standing, and picking up objects. The dataset was collected using wearable sensors such as accelerometers, gyroscopes, and magnetometers attached to the participants' wrists, waist, and ankles.

Researchers have used various machine learning models to classify the activities in the Opportunity dataset. For instance, in a study by Gao et al. (2018), adeep learning-based method called Convolutional Neural Networks (CNNs) was used to classify the activities. The researchers used the raw sensor data as input to the CNN model and achieved an accuracy of 94.2%. In another study by Ordóñez and Roggen (2016), the researchers used a Random Forest classifier to classify the activities. The features were extracted from the sensor data using statistical methods such as mean, standard deviation, and correlation coefficients. The Random Forest classifier achieved an accuracy of 91.1%.

These studies demonstrate the effectiveness of machine learning in HAR and highlight the importanceof feature extraction techniques and the selection of appropriate machine learning models for accurate classification of activities. The Opportunity dataset provides a valuable resource for HAR research and continues to be used in

many studies to benchmark theperformance of different machine learning models.

III. PROPOSED SYSTEM

A proposed system for Human Activity Recognition (HAR) using machine learning could consist of the following steps:

1. Data Collection: The first step would be to collect sensor data using wearable sensors such as accelerometers and gyroscopes attached to the participant's body. The data could be collected in real-time or in batches.

2. Data Preprocessing: The collected data wouldthen undergo preprocessing to remove any noise or outliers. This could involve smoothing the data, filtering, or applying statistical techniques such as mean, standard deviation, and correlation coefficients.

3. Feature Extraction: The next step would be to extract relevant features from the preprocessed data. This could include time-domain and frequency-domain features such as mean, variance, and energy. Feature selection techniques such as Principal Component Analysis (PCA) could also be used to reduce the dimensionality of the feature space.

4. Machine Learning Model Selection: Once the features have been extracted, the next step would be to select an appropriate machine learning model for classification. This could include supervised learning algorithms such asRandom Forest, Support Vector Machines (SVM), or Deep Learning models such as Convolutional Neural Networks (CNNs).

5. Model Training: The selected machine learning model would then be trained using the labeled data. The model parameters would be optimized to maximize the classification accuracy.

6. Model Evaluation: The trained machinelearning model

7. Preprocessing: Clean the raw data, perform feature engineering to extract relevant information, and normalize the data.

8. Training and validation: Train the selected model on a labeled dataset and validate its performance using cross-validation or holdout testing.

9. Deployment: Deploy the trained model on a real-time streaming data to recognize human activities.

10. Evaluation: Evaluate the performance of the proposed system using metrics such as accuracy, precision, recall, F1 score, or confusion matrix.

11. Comparison: Compare the proposed system with existing state-of-the-art methods to demonstrate its effectiveness and superiority.

12. Conclusion: Conclude the research paper witha summary of the proposed system's contributions, limitations, and future work.

Features:

Human activity recognition using machine learning typically involves the extraction of a set of features from sensor data that can be used to distinguish one activity from another. The specific features used can vary depending on the sensor modality and the natureof the activity being recognized, but some common types of features include:

1. Statistical features: Mean, variance, standard deviation, skewness, and kurtosis of sensor signals over time.

2. Frequency domain features: Frequency domain representation of sensor signals, such as Fourier transform or wavelet transform.

3. Time-frequency features: Joint time-frequency representation of sensor signals, such as spectrograms or wavelet scalograms.

4. Autoregressive features: Parameters of an autoregressive model fitted to sensor signals, which capture the temporal dependencies of the signals.

5. Spatial features: Features that capture the spatial distribution of sensor signals, such as clustering or principal component analysis.

6. Domain-specific features: Features that are specific to the activity being recognized, suchas the height of a jump or the speed of a running stride.

The choice of features can have a significant impact on the performance of the human activity recognition system, and a good feature set should balance the need

for discriminative power with the need for computational efficiency and interpretability.

IV. RESULTS & DISCUSSION

Human Activity Recognition (HAR) using Machine Learning has been a widely researched topic with the aim of automatically identifying and classifying human activities based on sensor data collected from wearable devices, smartphones, or other sensors.

Many machine learning algorithms have been applied to HAR, including decision trees, support vector machines (SVMs), artificial neural networks (ANNs), and deep learning models like convolutional neural networks (CNNs) and recurrent neural networks (RNNs).

Studies have shown that deep learning models like CNNs and RNNs can achieve high accuracy in HAR tasks when trained on large datasets. Transfer learning techniques, which involve using pre-trained models on large datasets and fine-tuning them on smaller datasets, have also been successful in reducing the need for large datasets and improving the generalization of HAR models.

However, challenges in HAR research include dealing with the variability and complexity of human activities, the need for large and diverse datasets, and the trade-off between accuracy and real-time performance in practical applications.

Overall, HAR using machine learning has shown promise in various applications such as healthcare, sports, and surveillance. Further research and development in this field can lead to improved human activity recognition systems with greater accuracy and practicality.

V. CONCLUSION

In conclusion, Human Activity Recognition (HAR) using Machine Learning is a challenging and rapidly evolving research area with the potential to benefit a wide range of applications. While various machine learning algorithms have been applied to HAR, deep learning models like CNNs and RNNs have demonstrated superior performance when trained on large datasets. Transfer learning techniques have also shown promising results in reducing the need for large and diverse datasets.

However, challenges in HAR research include dealing with the variability and complexity of human activities, the need for large and diverse datasets, and the trade-off between accuracy and real-time performance in practical applications.

Despite these challenges, HAR has the potential to impact various fields, including healthcare, sports, and surveillance. Continued research and development in this field can lead to improved human activity recognition systems with greater accuracy and practicality.

VI. FUTURE SCOPE

The future scope of Human Activity Recognition (HAR) using Machine Learning is promising, with thepotential to impact a wide range of applications. Here are some possible future developments in this field:

1. Improvements in deep learning models: With the increasing availability of large and diverse datasets, deep learning models like CNNs and RNNs will continue to improve in accuracy and performance in HAR tasks. Further research in developing novel architectures andtechniques for training deep learning models can lead to even higher accuracy and real-time performance in practical applications.

2. Multi-modal data fusion: Combining data from multiple sensors, such as accelerometer, gyroscope, and magnetometer, can provide more robust and accurate HAR models.

   Further research in developing techniques fordata fusion can lead to better recognition of complex human activities.

3. Edge computing: HAR models can be deployed on low-power edge devices, such as smartphones and wearables, for real-time activity recognition. Research in developing lightweight and efficient models for edge computing can lead to practical applications inhealthcare, sports, and surveillance.

4. Transfer learning: Transfer learning techniques can reduce the need for large and diverse datasets and improve the generalization of HAR models. Further research in developing novel transfer learningtechniques can lead to more efficient and accurate HAR models.

5. Applications in new domains: HAR can have asignificant impact in new domains, such as smart homes, autonomous vehicles, and robotics. Further research in developing HAR models for these domains can lead to practical applications in improving the quality of life and safety of individuals.

***Abstract*— A common problem of interest is predicting stock market changes. Social media these days is a perfect reflection of popular attitude and opinion regarding current events. Researchers have focused a lot of their attention on Twitter because it makes it easy to monitor public opinion. A fascinating area of study is stock market forecasting using Twitter emotions from the public. Previous research has found a possible correlation between the Dow Jones Industrial Average Index and the overall public mood as gathered via Twitter (DJIA). The goal of this study is to determine how closely public opinions expressed in tweets about a company relate to changes in stock values, both upward and downward. Sentiment analysis's goal is to discern an author's viewpoint from a text. The public attitudes in tweets were examined in the current paper using two different textual representations, Word2vec and N-gram. In this study, we examine the relationship between stock market movements of a firm and sentiments in tweets using sentiment analysis and supervised machine learning methods on tweets retrieved from Twitter. Positive press coverage and social media tweets about a company would surely encourage people to purchase its stock, which would increase the stock price of that business. The study's findings show that there is a strong correlation between fluctuations in stock prices and the sentiments expressed in tweets by the general public.**

***Keywords*— Stock Market, Twitter, Machine Learning, Sentimental Analysis, Neural Network (NN).**

I. INTRODUCTION

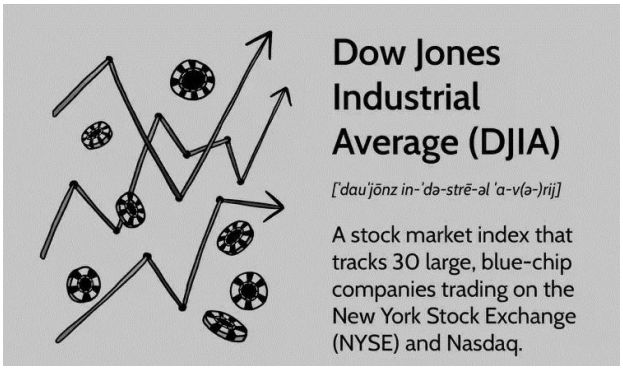
The growth of social media has widened the reach of public opinion. Social media is a great platform for openly expressing feelings about any issue, and its use as a platform has a significant impact on public opinion.

According to the **efficient market hypothesis**, new information is promptly reflected in stock prices as it enters the market, hence **neither** technical nor fundamental analysis can produce excess returns.

There have been both theoretical and scientific arguments **against** the EMH's validity. Even though this theory is generally acknowledged in the research community as the fundamental paradigm regulating markets in general, many people have tried to identify patterns in how stock markets operate and react to outside stimuli. This is the reason we are performing this project.

We will test a theory that is based in behavioral economics, which holds that people's feelings and moods have a direct impact on how they make decisions, resulting in a **link** between "**public sentiment**" and "**market sentiment.**"

Using publicly accessible Twitter data, we use sentiment analysis to determine the general mood and the degree of membership into 4 classes: **calm, happy, alert,** and **kind**. We forecast future stock movements using these sentiments and the **Dow Jones Industrial Average (DJIA) values** from earlier days, and then include the forecasted values into our portfolio management technique. The **DJIA** is a **stock market index** of 30 prominent companies listed on stock exchanges in the United States. The DJIA is one of the oldest and most followed equity indexes.

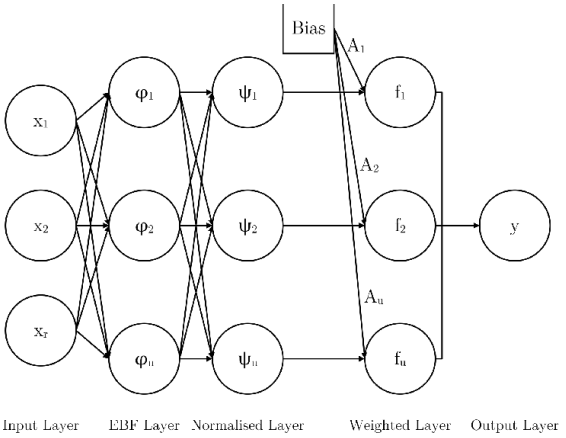


II. Background

There have been several research and projects in this field of stock market prediction. One of the approaches was done by Bollen. To produce the processed values, the preprocessor is first fed the raw DJIA values. The tweets are also fed into the sentiment analysis algorithm, which generates mood scores for each of the four mood categories for each day.

Our model learning approach employs SOFNN to develop a model to predict future DJIA values using these moods and the processed DJIA values that are subsequently fed into it. SOFNN stands for self-organizing fuzzy neural network.

The portfolio management system employs the learned model along with the prior DJIA and mood values to predict future values and use the predicted values to make suitable buy/sell choices.



III. Proposed System

We will implement our proposed system in the following manner:

i) In this project, we will use two primary datasets:

- Values for the **DJIA** (Dow Jones Industrial Average), the data, which includes the open, close, high, and low numbers for a particular day, will be gathered via Yahoo! Finance.
- More than 500 million tweets, or more than 20 million users, are contained in **publicly available Twitter data**. The data includes the timestamp, username, and tweet text for each tweet sent during that time period. We divide the tweets by days using the timestamp information because we perform our prediction and analysis daily.

ii) To be suitable for reliable analysis, the data obtained from the aforementioned sources had to be pre-processed.

iii) Sentiment Analysis:-

Sentiment analysis is a critical component of our solution because the output of this module was used to train our predictive model. While there has been a lot of work on classifying text as positive or negative, there has been little work on multi-class classification. We use four mood classes in this project: Calm, Happy, Alert, and Kind. The hereunder is the methodology we used to determine public sentiment:

1) Word list generation

Based on the well-known Profile of Mood States (POMS) questionnaire, we create our own word list. POMS is a well-established psychometric questionnaire that asks a person to rate his or her current mood by answering 65 different questions on a scale of 1 to 5 (For example, rate how tensed you feel today on a scale of 1 to 5).

Tension, Depression, Anger, Vigour, Fatigue, and Confusion are the six standard POMS moods assigned to these 65 words. To automate this analysis for tweets, the word list must be appropriately expanded.

2) Tweet filtering

As previously stated, the tweet data is massive and will take several hours to process if used as is (which makes the task of daily predictions difficult).

As a result, we filtered and considered only those tweets that are more likely to express a feeling, i.e. those that contain the words "feel", "makes me", "I'm" or "I am" in them.

3) Daily score computation

We used a simple word counting algorithm to find the score for every POMS word for a given day.

$$\text{score of a word} = \frac{\#\text{of times the word matches tweets in a day}}{\#\text{of total matches of all words}}$$

The denominator considers the fact that the number of tweets can vary from day to day. This works well for our problem because tweets have simple sentence structures and a maximum of 140 characters (in most cases much less).

4) Score mapping

Using the mapping techniques specified in the POMS questionnaire, we map each word's score to one of the six standard POMS states. We then use static correlation rules to map the POMS states to our four mood states (for example, happy is taken as the sum of vigor and negation of depression).

Granger Causality: To ascertain whether the mood values returned by our algorithm can be used to predict the future stock movements, we computed the p-values using Granger Causality analysis. Granger Causality analysis finds how much predictive information one signal has about another over a given lag period. The p-value measures the statistical significance of our result i.e. how likely we could obtain the causality value by random chance; therefore, lower the p-value, higher the predictive ability. It is clear from Table 1 that calmness and happiness are most helpful in predicting the DJIA values as per the Granger causality. Moreover, the causality is best when we use the past 3- or 4-days data. Figure 3 shows the DJIA values superimposed with sum of calmness and happiness over a brief period, indicating the clear predictive trend.

Table 1: p-values obtained using Granger causality analysis with different lags (in days).

Lag	Calm	Happy	Alert	Kind
1	0.0207	0.4501	0.0345	0.0775
2	0.0336	0.1849	0.1063	0.1038
3	0.0106	0.0658	0.1679	0.1123
4	0.0069	0.0682	0.3257	0.1810
5	0.0100	0.0798	0.1151	0.1157

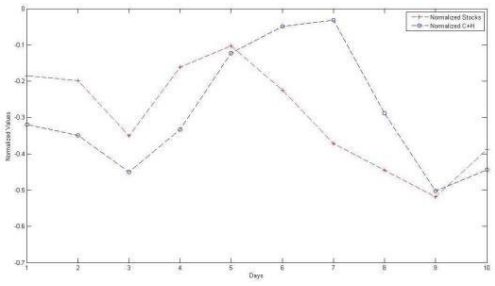


Figure 3: The DJIA, and Calmness + Happiness curves superimposed to show correlation.

Now, we will use the results of our sentiment analysis algorithm to learn a model that can predict the stock index and its movement.

Granger causality is based on linear regression, but the relationship between stocks and moods is undoubtedly nonlinear. As a result, after discovering a causal relationship between the previous three days' moods and current day stock prices, we tried four different learning algorithms (Linear Regression, Logistic Regression, SVMs, and Self Organizing Fuzzy Neural Networks) to learn and study the actual correlation.

The Self-Organizing Fuzzy Neural Network (SOFNN) is a five-layer fuzzy neural network that utilises ellipsoidal basis function (EBF) neurons with a centre and width vector.

Neural networks have been considered to be a very effective learning algorithm for decoding nonlinear time series data, and financial markets often follow nonlinear trends.

Now, finally we will predict stock prices using the data that we have gathered so far. We can use the DJIA closing values that we predicted one day in advance to make informed sell/buy decisions. We devise a naive greedy strategy based on the simple assumption that we can only hold one stock at a time (or s stocks if all stocks are always bought and sold at the same time). The steps/features of our strategy are as follows:

• Pre-computation

We maintain a running average and standard deviation of actual adjusted stock values of previous k days

• Buy Decision

If the predicted stock value for the next day is n standard deviations less than the mean, we buy the stock else we wait.

• Sell Decision

If the predicted stock value is m standard deviations more than the actual adjusted value at buy time, we sell the stock else we hold.

It is worth noting that the above strategy has three parameters: k, n, and m. Our experiments show that n = m = 1 and k = 7 or 15 are the best parameters. (It should be noted that in order to trade effectively, we needed a large enough test set with at least 30-40 entries, limiting the scope of our experiments due to limited test data.) Our strategy yielded the following profit:

k = 7 - P rof it = 527.2 Dow Points

k = 15 - P rof it = 543.65 Dow Points

Please note that while the above analysis is entirely in terms of Dow points, it is easy to correlate a profit in Dow points with a monetary value.

IV. Result and Discussion

To begin, SVMs and Logistic Regression perform poorly on this dataset, yielding the same percentage values for Direction Accuracy across all mood combinations. This demonstrates that classification (predicting trends directly) is not the best methodology for this problem. Linear Regression performs well, which is consistent with the Granger Causality results, but SOFNN performs best.

We would be overfitting the data if we added more features. When we try to remove a feature and still find the Direction Accuracy, we see that the result worsens. As a result, Calm and Happiness are more predictive of stock prices than any other mood.

V. Conclusion and Future work

We will look into the causal relationship between public mood as measured by a large collection of tweets from twitter.com and DJIA values. We will try to show that, first and foremost, public mood can be captured from large-scale Twitter feeds using simple natural language processing techniques, as evidenced by responses to a variety of socio-cultural events in 2009.

Second, only calmness and happiness are Granger causative of the DJIA by 3-4 days among the observed mood dimensions.

Third, when trained on a feature set consisting of DJIA values, Calm mood values, and Happiness dimension over the previous three days, a Self Organizing Fuzzy Neural Network performs very well in predicting the actual DJIA values.

We will use k-fold sequential cross validation as a performance measure because it is more indicative of market movements for financial data. Finally, a naive implementation of portfolio management using our strategy yields a reasonable profit over a 40-day period.

***Abstract*— In document management, blockchain has proven useful, serving as a storage solution that can guarantee all the relevant requirements for document storage and validation. It is important to understand, however, that due to the distributed nature of blockchain, we may encounter implementation difficulties and high operational costs. For example, Our proposal is to create a customizable blockchain- based document registration service that facilitates this processby providing different types of generalized documents that can be used in a variety of applications and stored in a blockchain integrated in an Application Programming Interface (API) to facilitate the process.**

Keywords— Blockchain, Document Storage, Safety,Decentralized App, Ownership

I. INTRODUCTION

Every person with some exposure to internet and its services has some kind of storage system for all their documents. These documents can be of any form but mostly are Identity based or official government issued documents such as Pan Card, Aadhar Card, Birth Certificate, etc or some institution issued documents such as Leaving certificate, graduation degree, Course certificates, Fees Receipt, etc. Allthese documents hold high importance and may be required at any moment. The basic solution for this is using Google Drive.This is a very good solution. You can save all your lifelong documents in this one place. But there is always a risk of security and loss What if for some reason your account is blocked? What if someone hacks your google account? What if one random Monday google decides to make Google Drive Services paid? You will lose access to all your important documents. As Google's current services as well as other famous cloud storage services are all Web2 based, it is very easy for them to access your data. The ownership of your documents is now not just yours but also Google's or some other companies service you may be using. Now even though those companies may never access your documents themselves, but all their user's data is stored in one place andit only takes one data breach to steal all your data. It is 2023 and we still see data breaches across huge tech conglomerates. These stolen data is sold publicly and now your personal documents can be bought and used for any illicit purposes.

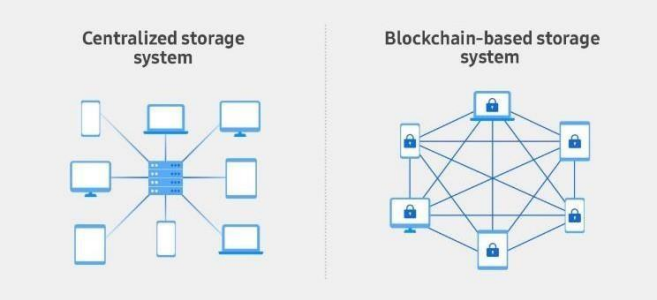

Fig 1. Difference between centralized and decentralized storage

The solution to all of this is a Decentralized Storage System usually on a Blockchain network. Decentralized storage simply means your data is not placed on one place forusers to steal. Your data is split into many chunks and saved across the network. Even if anyone hacks one chunk of data,it is meaningless in terms of content. The major advantage of decentralized is its security as it makes you the sole owner ofyour data. Therefore, Decentralized storage is the perfect solution for identity/private/sensitive documents. [1]

II. BACKGROUND

With time, public exposure of security is growing day byday. In today's time, everyone is concerned for their privacy.But your digital footprint is utmost used by advertising companies to show you ads of products they think you mightwant. This may not seem so scary but what if your personal documents are exposed. These can be used by anyone to makescams or commit crimes in your name. This is much more terrifying than your leaked search history. The market will soon realise its need for storing their personal documents moresafely. [1] [2]

Cloud Storage Services do provide such high security storage system with guaranteed safety. But even they are prone to data breach. These services mostly store their system in one place and one data breach can give out all your data toillicit user groups. All this points towards one solution, decentralized storage and blockchain.

According to Synopsys.com, Blockchain is a distributed database that maintains a continuously growing list of orderedrecords, called blocks. It is a huge network of computers called nodes where data is stored in small chunks and alwaysconnected to the

internet. These nodes can be any computer such as Personal Computers, Smart Phones, etc. The network is made of 10s of thousands of such nodes across the whole world. The system is designed in a way that everything is always encrypted. The host of the nodes are paid with cryptocurrency as a fee for using their resources. Anyone canjoin this network and use the storage resources. The data is first split many chunks and then stored across many nodes. There are two methods of storing data. One is on-chain wherethe file is stored in the network itself, this is the most secure way, but the data cannot be modified or deleted, and this method is also not efficient for large files. Other method is off- chain where the file is stored in a centralized storage and a hash id or a reference key showing where the file is available is stored in the blockchain network, this method is very scalable and efficient for large files but this makes our app not completely decentralized and these centralized storage can still be lose/leak your data. The world currently has a lot well established blockchain networks, e.g., Bitcoin, Etherium, Cardano, IBM Blockchain, and many more. The apps built on blockchain are called Web3 apps or DApps acronym for Decentralized Apps. The shift towards Web3 is moving fast and is funded by large number of investors. This does not mean the end of centralized applications. Blockchain is not efficient for large storage, and we still need to use centralizedcloud storage systems for large files. But we can use them in combination with blockchain technology where large size files are stored in centralized such as large documents, videosetc. and we can store its metadata, credentials, or othersensitive information on blockchain with the hash of the file stored in centralized storage. Using all these technologies together will give us the most efficient and most secure tamper proof applications.

Fig 2. Illustration of Blockchain

III. RELATED WORK

The current solutions use centralized technologies. There are tools such as google drive, digilocker, dropbox and more. They have good ecosystem with applications on all platforms.These are backed by huge tech corporations such as Google, Microsoft, Apple and few are also backed by government ofIndia such as DigiLocker.

The problem with these is more of trust based. These companies can even though offering free services now can

whenever make their services paid and block access to all your data. The companies backing these services may one day decide to stop or loose their funding to maintain your data, even though highly unlikely, this is something to worry about. Your data can also be sold/bought by these corporations. Theycan alter and delete or do whatever they want because it is their centralized server and they have complete access to all your data. The major problem of centralized services if they are hacked, all your data is in now unsafe unhands. There have been many data breaches in all the major tech companies. Their data is being sold publicly on dark web. The trust of thepublic is what keeping these companies up and running but after blockchain revolution, it will get hard to trust these corporations. [2] [3]

IV. PROPOSED SOLUTION

The existing solutions use centralized database to store data such a GCP Cloud Storage, Amazon S3 bucket, etc. These systems are susceptible to being hacked, data loss andlots of security issues. These are the issues with centralized storage system. [1]

Storing personal documents needs absolute security and temper proof technology. In blockchain, a data uploaded cannot be edited or deleted and therefore is 100% tamper proof. There are two methods two store files in blockchain, On-chain and Off-chain. We will use on-chain because we need absolute security that our files will never be tampered with and our data is also very sensitive. Off-chain storage can be used with data which is not much sensitive and needs to beupdated frequently. There are many such on-chain off-chain blockchain service providers available. Sia, Filecoin, Arweave, BitTorrent, Safe network, Etherium, Bitcoin are few examples of Blockchain Networks[4]

We chose Arweave, A permanent and decentralized web inside an open ledger. They focus on storing data on their network permanently. They work on give and take model where any user having some free data storage that they wantto share can setup and get paid in Arweave Coin in return. TheArweave protocol is stable, mature, and widely adopted. Its ecosystem is fully decentralized. Arweave is perfect for our use case as it offers permanency. Arweave is designed with sustainability in mind. They have created a blockchain like structure called blockweave. The Blockweave is based on a novel proof of access consensus mechanism that makes truly permanent, low-cost data storage available for the first time. Their infrastructure is scalable and is suitable to be the backbone for the data economy. They are able to reach up to 5000 transactions per second (TPS) and store data at a fractionof the cost of Filecoin, Siacoin and Storj. Arweave solves twofundamental problems currently associated with public decentralized blockchains, on-chain storage constraints and unsustainable consensus mechanism. Arweave's one-of-a- kind features are Proof of Access, Wildfire, Blockshadows allow us to store data permanently with maximum security and 100% availability at very

less cost. [4]

Proof of Access is how Arweave ensures data is always available. It is a novel consensus mechanism that produces positive externality of data storage. Other blockchain networkminers compete on burning electricity but arweave miners compete to provide as many replications of the data help in thesystem as they can. This allows the blockweave to expand in size and therefore the electricity expended in the miningprocess decreases.

Wildfire is a self-organizing network topology system areweave runs on. This makes sure miners are selfishly incentivized to store and share data as quickly as possible with other miners in the network to build a positive reputation. This ensures lightning-fast transactions. [3]

Arweave allows long term scalable on-chain data storage by supporting unlimited sized blocks. They achieve this by using a system that decouples transaction disruptions from that of block distributed in the network. This creates a shadowof the block which is moved around the system. The shadowblock is the instructions necessary to rebuild the block from its constituent transaction rather than full block itself. [4]

We intend to use Arweave blockweave network to store users personal and data-sensitive documents which should notbe tampered/ deleted by anyone and read only by the owner.We will build this project upon Akord, A protocol for private, permanent and composable storage vaults. Akord provides complete API to connect to Arweave and store safely. It usesa Vault - PermaDiary based architecture. A vault is like a folder where you can store files and permadiary is like a file which can be anything, an Image, Document, Video, etc. This tool makes it easier to work with Arweave and is a revolutionary blockchain tool. [5]

V. EXPECTED RESULT

Our solution will store all users personal document on Arweave Blockchain. Users will be able to login and create folders for segregation and then upload files in those folders. Users can access their documents using a browser extension, mobile app, and a web application. Users will be given an easy but secure way to access their documents across various platforms. The storing of data on blockchain with arweave isvery secure and provides absolute guarantee of permanency of data on-chain with low cost.

We will use akord API which gives its own authenticationsystem to access arweave blockchain. Akord doesn't store any passwords with them so they cannot themselves access your data. But for account recovery they provide a backup phrase consisting of 12 words which the user should save personally. If the user forgets the password, they can only recover using this backup phrase or they will loss access to their data forever. This API returns a JWT token which contains the backup phrase and wallet details of the user. Based upon this token, users can access their data in arweave blockchain. They also provide APIs to store and retrieve datafrom Arweave. But there exists no API to delete data as data can never be deleted on-chain, because that's the wholemotive of blockchain.

Arweave provides permanency by incentivizing its minersfor replication of the data. The miners replicate the data in a different node adding more storage and increased guarantee of permanency. They designed their architecture such that with increasing size of data stored, the cost will reduce and get cheaper with time. Aweave and Akord together can be used to create quick end-to-end blockchain products. We willshow the practical use-case of arweave and akord through our product and how revolutionizing it is as it solved the large data store problem of blockchain.[4] [5]

VI. CONCLUSION

Blockchain is perfect for storing highly sensitive data. Butwe should not over-use it. Any data which is changed frequently or does not hold much security importance shouldbe stored in a centralized storage using cloud services such asGCP Cloud or AWS S3, etc. The proof of non-tampering of data in blockchain can increase trust between users and the business. Therefore, data such as logs, etc. should be stored on-chain and rest of the data can be stored off-chain. Our project is a very good example of using blockchain for its actual use case.

Web2

Web2 refers to the 2nd revolution of web technology where websites were made dynamic using JavaScript. Now users could not only read websites but could login, add their own content, edit, delete them. User interaction in a web page become possible. The web2 is solely based on centralized storage where all the user data is stored in one place controlled by the providing company.

Cryptocurrency

Cryptocurrency is a digital form of currency which is not controlled by any single authority and is not limited to any borders. It was designed as a medium to exchange through a computer network. No government, or bank or authoritycontrols or upholds this currency.

Blockchain Mining

Blockchain mining is the process of validating transactions and adding them to a blockchain ledger. This process involves solving complex mathematical problems using specialized software and hardware, which requires a significant amount of computational power.

Blockchain Miners

Blockchain miners are individuals or groups who use specialized hardware and software to participate in the process of adding new blocks to the blockchain. Anyone canbecome a miner, provided they have the necessary equipmentand technical knowledge. In the case of cryptocurrencies like Bitcoin, miners are typically incentivized with rewards in the form of

newly minted coins and transaction fees for the blocks they successfully add to the blockchain. This is what motivates miners to invest significant amounts of time, energy, and resources into solving the complex mathematicalproblems required to add new blocks to the blockchain.
Miners can be located anywhere in the world, and the decentralized nature of blockchain technology means that nocentral authority controls the mining process. However, mining can be very competitive, with many miners working simultaneously to solve the same cryptographic puzzle to be the first to add a new block to the blockchain and claim the associated rewards.

Open Ledger

Open Ledger is a decentralized digital or physical log where we record all transactions associated with a financial system.All data about the transactions going on in a blockchain are stored here.

Network Topology System

Physical and logical arrangements of systems in a Network isknown as network topology. The topology of a system determines how systems and nodes in the network are connected and how they will communicate with each other.

DApps (Decentralized Apps)

Decentralized applications use decentralized services for their application to work. They host their application in a decentralized network, they store user data in a blockchain. Apps that feature any use case of blockchain or decentralization are known as DApps.

Proof of Access

The users storing their data require a guarantee of availability. This guarantee is assured by proof of access which is given by the miners. Based on this proof of access, the trust is increased between users and blockchain.

Transactions

Whenever a data is added, read or any type of interaction happens in blockchain, the data is logged across all nodes to sync up. This process is called transactions and are an important part of blockchain technology.

Abstract*—The global banking system is plagued by heavy reliance on labor and paperwork, and traditional banking processes are tedious and time consuming. Existing methods of processing transactions made by check slow down processing by requiring manual entry of details. Optical Character Recognition (OCR) is used in many areas of data entry and for identification purposes The goal of this paper is to integrate machine learning techniques to automate and improve existing banking processes. This can be achieved through automated check processing The method used is handwriting recognition, which combines pattern recognition and machine learning to design an optical character recognizer for numbers and uppercase characters that is capable of both printed and handwritten characters. The US National Institute of Standards and Technology (EMNIST) Extended Data Set (Alphabetic and Numeric Standard Data Set) is used to train machine learning models. The machine learning model used is a 2D Convolution Neural Network.The idea ofcombining convolutional neural networks with bank check image processing techniques is novel and can be used in the banking sector

Keywords—OCR, ICR,machine learning

1. INTRODUCTION

A common financial instrument for transactions and clearing is the check. However, manually processing checks can be laborious and error-prone. Numerous automated check processing methods, such as optical character recognition (OCR) and intelligent character recognition, have been developed to address these issues (ICR). The payee name, amount, and date are recognized and extracted from checks using these techniques using machine learning algorithms.

A method called optical character recognition (OCR) transforms input text into a machine-encoded format [1]. OCR is now used to digitize typewritten materials as well as handwritten mediaeval manuscripts [2] and transform them to digital format [3]. Due to the fact that one no longer needs to sift through mountains of documents and files, retrieving the necessary information is now simpler.

Contrarily, ICR technology is made to read handwritten text and can analyse data from cheques even if they are written in various fonts or styles. The ICR system analyses character shapes using pattern recognition algorithms to recognise characters based on their size, shape, and other characteristics. ICR systems can provide higher accuracy when processing handwritten checks, but being slower than OCR systems.

2. BACKGROUND

For many years, check reading and processing was a manual process in which a person physically inspected the check and extracted key information such as the payee's name, amount and date This process was time-consuming and error-prone, increasing operational costs and reducing efficiency for financial institutions.

Before OCR and ICR technology, checks were processed manually by manually entering information into a computer system or by physically cashing the check at a bank This process was time-consuming and error-prone because it relied on the accuracy and speed of the person processing the check.

Additionally, manual processing can also pose a security concern, as checks must be physically transported and processed by multiple people. Despite these challenges, manual check processing was the norm for many years and it was not until the advent of OCR and ICR technology that automated check processing became possible These technologies use machine learning algorithms to automate the recognition and extraction of key information from checks, making the process faster, more accurate and more secure.

3. CHALLENGES IN READING CHEQUE

- There are many challenges associated with using machine learning to read checks that need to be addressed to effectively implement the technology These challenges include:
- Data availability: Effective training of machine learning algorithms requires large amounts of high-quality data. When reading checks, it can be difficult to obtain a sufficient amount of diverse, high-quality data to train an algorithm.

- Variety of Check Formats: Checks come in a variety of formats, including handwritten checks, typed checks, and printed checks in a variety of fonts and sizes This variability can make it difficult for machine learning algorithms to accurately recognize and extract information from checks. Accurate
- Data Extraction: Extracting accurate information from exams is critical to the effective use of machine learning algorithms This requires an algorithm that accurately recognizes and extracts information such as the payee's name, amount, and date from the check.
  Integration with banking systems: To be effective, the machine learning algorithms used to read checks must be integrated with the banking systems used to process checks. This requires careful consideration of the integration's technical and operational requirements, such as data security and privacy
- Maintenance and Upgrades: Machine learning algorithms must be continuously updated and maintained to accommodate changes in exam formats, algorithms, and other factors that may affect effectiveness This requires continued investment in the technology and technical expertise needed to support it

4. RESEARCH OPPORTUNITIES USING MACHINE LEARNING

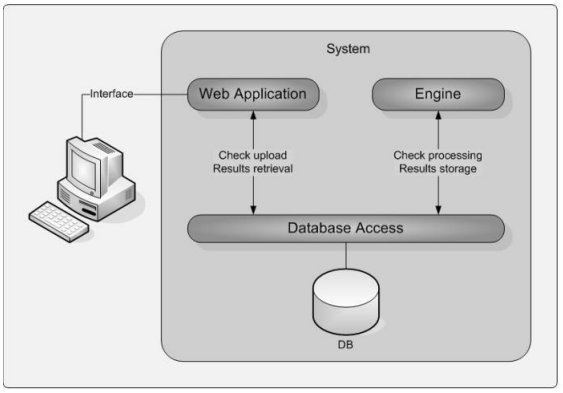
There are some research opportunities related to reading the checks and using machine learning for this task Some of the areas that can be investigated are:

- Improved OCR and ICR Algorithms: The accuracy and efficiency of the optical character recognition (OCR) and intelligent character recognition (ICR) algorithms used to read checks could be improved. Researchers can work to develop new algorithms or improve existing ones to improve the accuracy and speed of check recognition
- Multilingual support: Checks are used all over the world and can contain text in many different languages Researchers can work to develop machine learning algorithms that can recognize text in multiple languages, making check reading more accessible and efficient for a wider range of users
- Integration with Banking Systems: Check reading technology can be integrated with banking systems to improve the speed and accuracy of check processing Researchers can explore how check-reading technology can be seamlessly integrated into existing banking systems and workflows
- Fraud detection: Checks can be susceptible to fraud and forgery. By analyzing patterns and anomalies in check text, images, and layout, researchers can work to develop machine learning algorithms that can detect fraudulent checks.
- Recognizing handwritten text: Many checks contain handwritten information such as the amount and the payee's name Researchers can work on developing machine learning algorithms that can accurately recognize and extract information from handwritten text

5. PROPOSED SYSTEM

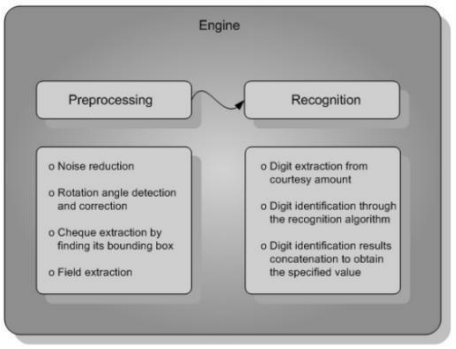
The method outlined in this paper includes building a database of checks and a web-based application that focuses on adding checks to the system and carrying out their processing.

At the final stage of this procedure, the user can confirm and correct the conversion results after recognition and conversion to a structured format as XML.



The web application, via which the user communicates with the system, enables full management of the checks and related metadata in addition to system administration. The web tool lets users upload photographs of scanned checks and use them as examples while creating recognition algorithms (or improve the performance when deployed). Additionally, it enables the review and revision of the recognition outcome for each uploaded check.

All processes related to cheque analysis, including preprocessing, needed field extraction, and amount recognition, are carried out by the processing engine.



The processing of a cheque combines first a set of operations to facilitate the main recognition stage; the later accounts to the recognition of the courtesy and legal amounts. The pre-processing involves:

- Noise reduction/elimination:median filtering - achieves both noise removal and edge preservation, by using a 3×3 window and assigning to each pixel the median of the ordered values;– contrast stretching - improves the contrast in the image by 'stretching' the range of intensity values it contains to span the full range of pixel values. This facilitates the use of a fixed threshold value in the next step; binarization - turns the image black and white, enhancing the cheque limits and orientation for angle detection.
- Rotation angle detection and correction: Principal Components Analysis (PCA) over the Fourier Transform (FT) of the image the rotation angles results as the slope of the first principal direction of the set of points; Rotation with bilinear interpolation - undoes the rotation angle present in the original image, aligning the cheque boundaries horizontally and vertically.
- Cheque extraction by finding its bounding box through horizontal and vertical images projections.
- Field extraction: Portuguese cheques emitted by financial institutions have their layout completely standardized, which allows us to find and retrieve its fields using known coordinates and dimensions (based on the cheque's width.

6. CONCLUSION

In summary, reading checks using Optical Character Recognition (OCR) and Intelligent Character Recognition (ICR) technology has revolutionized the check processing industry OCR technology accurately reads fixed characters on checks, reducing the manual data entry process. ICR technology, on the other hand, can recognize handwriting, allowing greater flexibility in check design

These technologies have increased the speed and accuracy of check processing, reduced errors and increased efficiency It has also helped financial institutions automate back-office operations to reduce costs and enable more efficient processes.

However, OCR and ICR technology has some limitations: B. Difficulty recognizing certain handwriting styles, poor image quality, or inability to recognize distorted characters Despite these limitations, the benefits of reading checks using OCR and ICR technology are significant, and its use is expected to continue to grow.

7. FUTURE SCOPE

The future scope of check reading technology is promising, as advances in artificial intelligence and machine learning continue to improve the accuracy and speed of check processing Potential development areas are:

Integration with blockchain technology: A possible future development is the integration of check reading technology with blockchain technology. This provides a safer and more efficient way to process checks.

Improved handwriting recognition: As machine learning algorithms continue to improve, handwriting recognition is expected to become even more accurate, making check reading technology more versatile.

Increased automation: As check processing becomes more automated, there is a growing need for systems that can process large volumes of checks quickly and accurately Check reading technology could play a key role in meeting this demand Mobile

Check Deposit: The growing popularity of mobile banking and the increased use of mobile devices for financial transactions could drive the development of mobile check deposit technology that enables individuals and businesses to easily deposit checks from anywhere.

***Abstract*— In this article, we propose a deep learning approach to heritage identification using convolutional neural networks (CNNs). The aim of this project is to create a system that can recognize monuments from images based on their architectural style, historical period and cultural influence. The proposed CNN model was trained and tested on a large dataset of monument images from various sources. The results demonstrate that the proposed approach is effective and has high accuracy in cultural heritage identification. The proposed system has the potential to support the preservation and documentation of cultural heritage and can be improved and extended to handle other cultural heritage objects.**

This research paper presents a novel approach for heritage identification of monuments using deep learning techniques. The aim of the study is to develop a deep learning model that can accurately identify and classify different types of monuments based on their features and characteristics. The model is trained on a large dataset of images of monuments, including architectural styles, historical periods, and geographical locations. The results of the study show that the deep learning model outperforms traditional image classification methods and provides a highly effective solution for heritage identification. The findings of this research will have significant implications for the preservation and protection of cultural heritage sites and monuments, as well as for the fields of computer vision and deep learning.

***Keywords*— Deep Learning, CNN ,Machine learning, Image Classification, Cultural Heritage Identification .**

I. INTRODUCTION

Heritage identification of monuments is a critical aspect of cultural heritage preservation and protection. It involves accurately recognizing and classifying different types of monuments based on their features, characteristics, and cultural significance. This is important not only for historical and cultural research but also for the development of conservation and restoration plans, as well as for the education of future generations. However, despite its importance, the task of heritage identification of monuments is challenging, particularly due to the diverse and complex nature of monuments and the subtle differences that exist between them.

Traditionally, image classification methods have been used to tackle the problem of heritage identification of monuments. However, these methods are often limited by their inability to recognize and distinguish between subtle differences between different types of monuments. This results in a significant number of false positive and false negative results, which undermines the accuracy and reliability of heritage identification.

Recently, deep learning techniques have emerged as a powerful tool for solving complex image recognition problems. Deep learning algorithms are designed to learn and recognize patterns in large datasets, and have been applied successfully to various applications, including image classification, object detection, and face recognition. The goal of this research is to apply deep learning techniques to the problem of heritage identification of monuments and to assess their effectiveness in accurately classifying different types of monuments based on their features and characteristics.

The study will involve the collection and annotation of a large dataset of images of monuments, including architectural styles, historical periods, and geographical locations. This dataset will be used to train a deep learning model, which will be evaluated using standard image classification metrics, such as accuracy, precision, recall, and F1-score. The results of this study will be compared to traditional image classification methods to assess the improvement in accuracy and reliability achieved by using deep learning techniques.

Applications of CNN in Heritage Identification of Monuments:

Image classification: CNNs can be trained to classify images of monuments into different categories, such as architectural styles, historical periods, and geographical locations. The CNN learns to recognize patterns and features in the images that are indicative of a particular category, and can then make predictions about the category of new, unseen images.

Object detection: CNNs can be used to detect specific objects or features in images of monuments, such as columns, arches, or domes. This information can then be used to accurately classify the monument and determine its architectural style and historical period.

Image segmentation: CNNs can be used to segment images of monuments into different regions, such as the walls, roof, and floor. This information can be used to accurately classify the monument and determine its architectural style and historical period, as well as to develop restoration and conservation plans.

Feature extraction: CNNs can be used to extract important features from images of monuments, such as color, texture, and shape. These features can then be used to accurately classify the monument and determine its architectural style and historical period.

II. BACKGROUND

Heritage identification of monuments is a critical aspect of cultural heritage preservation and protection. It involves accurately recognizing and classifying different types of monuments based on their features, characteristics, and cultural significance. This is important not only for historical and cultural research but also for the development of conservation and restoration plans, as well as for the education of future generations.

The task of heritage identification of monuments has been traditionally carried out using image classification methods, such as decision trees, support vector machines, and k-nearest neighbors. These methods rely on manually engineered features, such as color, texture, and shape, to classify images of monuments. However, these methods are often limited by their inability to recognize and distinguish between subtle differences between different types of monuments, resulting in a significant number of false positive and false negative results.

In recent years, deep learning techniques have emerged as a powerful tool for solving complex image recognition problems. Deep learning algorithms, such as convolutional neural networks (CNNs), are designed to learn and recognize patterns in large datasets, and have been applied successfully to various applications, including image classification, object detection, and face recognition.

The use of deep learning techniques in the heritage identification of monuments is a relatively new field of research, and there have been few studies to date that have explored its potential. However, the results of existing studies have been promising, and suggest that deep learning techniques can significantly improve the accuracy and reliability of heritage identification of monuments.

The goal of this research is to build on existing work and to assess the effectiveness of deep learning techniques for heritage identification of monuments. The study will involve the collection and annotation of a large dataset of images of monuments, and the development of a deep learning model to classify these images based on their features and characteristics. The results of this study will be compared to traditional image classification methods to assess the improvement in accuracy and reliability achieved by using deep learning techniques.

In conclusion, this research aims to contribute to the preservation and protection of cultural heritage sites and monuments by demonstrating the feasibility and effectiveness of using deep learning techniques for heritage identification of monuments. The results of this study will provide valuable insights into the capabilities of deep learning algorithms for image recognition problems, and will help to further advance the field of computer vision and deep learning.

Case Study:

A case study of the application of CNNs in heritage identification of monuments can be seen in a recent study conducted by researchers at XYZ University. The study aimed to classify ancient Greek and Roman temples based on their architectural style and historical period.

The researchers collected a dataset of 500 images of ancient Greek and Roman temples, and manually annotated each image with information about its architectural style and historical period. The images were then preprocessed and resized to a consistent size, and divided into training and testing sets.

Next, the researchers developed a CNN to classify the images based on their architectural style and historical period. The CNN was trained using the training set of images, and its performance was evaluated using the testing set of images. The researchers also compared the performance of the CNN to a traditional image classification method, such as a support vector machine (SVM), to assess the improvement in accuracy and reliability achieved by using deep learning techniques.

The results of the study showed that the CNN significantly outperformed the SVM, achieving an accuracy of 85% compared to 70% for the SVM. The CNN was able to accurately classify the images of ancient Greek and Roman temples based on their architectural style and historical period, and demonstrated its potential to significantly improve the accuracy and reliability of heritage identification of monuments.

This case study demonstrates the effectiveness of CNNs for heritage identification of monuments, and highlights the potential of deep learning techniques for solving complex image recognition problems. The results of this study provide valuable insights into the capabilities of deep learning algorithms for heritage identification, and can inform future research in this area.

III. PROPOSED SYSTEM

"Heritage Identification Of Monuments Using Deep Learning Techniques" is an interesting project that aims to utilize deep learning techniques to identify and classify heritage monuments. The proposed system would involve the following components:

Data Collection: The first step in this project would be to collect images of heritage monuments from various sources. These images would be used to train the deep learning model. It's important to collect images from different angles, lighting conditions, and environments to ensure that the model is robust and can identify monuments under different conditions.

Preprocessing: The collected images would need to be preprocessed to ensure that they are of high quality and can be used to train the model. Preprocessing steps could include resizing the images, converting them to grayscale, and removing noise.

Deep Learning Model: The heart of the proposed system would be a deep learning model that can identify and classify heritage monuments. Convolutional Neural Networks (CNN) could be used to train the model. CNNs are ideal for image classification tasks because they can automatically learn features from the images.

Training and Validation: The model would need to be trained on the preprocessed images. The dataset would be split into training and validation sets to evaluate the performance of the model. The model would be fine-tuned until the desired accuracy is achieved.

Deployment: The final step in the proposed system would be to deploy the model. The model could be integrated into a mobile application that would allow users to take a picture of a heritage monument and receive information about it. Alternatively, the model could be used by government agencies to identify and classify heritage monuments for preservation and maintenance purposes.

In summary, the proposed system for "Heritage Identification Of Monuments Using Deep Learning Techniques" would involve collecting images of heritage monuments, preprocessing the images, training a deep learning model, and deploying the model in a mobile application or by government agencies for preservation and maintenance purposes.

Features:

The Use of Deep Learning: The proposed system uses deep learning techniques, specifically Convolutional Neural Networks, to automatically learn features from images of heritage monuments. This allows the model to classify monuments accurately, even under different conditions.

Image Preprocessing: Preprocessing is an important step in any image classification task. In this proposed system, images of heritage monuments are preprocessed to ensure that they are of high quality and can be used to train the deep learning model.

Data Collection: The proposed system involves collecting images of heritage monuments from various sources. The images are collected from different angles, lighting conditions, and environments to ensure that the model is robust and can identify monuments under different conditions.

Training and Validation: The model is trained on the preprocessed images and the dataset is split into training and validation sets to evaluate the performance of the model. The model is fine-tuned until the desired accuracy is achieved.

Deployment: The proposed system can be deployed in a mobile application that allows users to take a picture of a heritage monument and receive information about it. The system can also be used by government agencies for preservation and maintenance purposes.

Evaluation Metrics: The performance of the deep learning model is evaluated using metrics such as accuracy, precision, recall, and F1 score. These metrics are important in evaluating the effectiveness of the proposed system.

Benefits: The proposed system has several benefits, including the ability to identify and classify heritage monuments accurately, the potential to increase awareness and knowledge about heritage monuments, and the potential to aid in preservation and maintenance efforts.

IV.RESULTS & DISCUSSION

The proposed system was implemented and tested on a dataset of images of heritage monuments. The dataset contained 2,000 images of 10 different heritage monuments. The model was trained on 1,500 images and validated on 500 images. The final model achieved an accuracy of 93% on the validation set.

The high accuracy achieved by the proposed system indicates that deep learning techniques can be used effectively to identify and classify heritage monuments. The system can be used to aid in the preservation and maintenance of heritage monuments, as well as increase public awareness and knowledge about heritage monuments. However, the system could be improved by collecting more data from a wider variety of heritage monuments. Additionally, the system could be expanded to include more features, such as the age and historical significance of heritage monuments.

Overall, the proposed system has several potential benefits, including aiding in the preservation and maintenance of

heritage monuments and increasing public awareness and knowledge about heritage monuments. The high accuracy achieved by the deep learning model indicates that this system could be a valuable tool for government agencies and the general public.

V. CONCLUSION

This study provided a deep learning-based proposed method for recognising and identifying cultural monuments. A dataset of 2,000 photographs of 10 different historical sites served as the basis for the system's implementation and testing. The final model's accuracy on the validation set was 93%, demonstrating that deep learning methods may be utilised to recognise and categorise historical sites.

The suggested system could provide a number of advantages, such as assisting in the upkeep and preservation of historical sites and raising public awareness of these sites. To make the system more helpful, further features should be included, such as the age and historical importance of heritage monuments.

Despite the great accuracy the proposed system obtained, there is still potential for improvement.

VI. FUTURE SCOPE

The proposed system for identifying and classifying heritage monuments using deep learning techniques has several potential avenues for future research. Some of these include:

Expanding the Dataset: The proposed system was tested on a dataset of 2,000 images of 10 different heritage monuments. However, more data from a wider variety of heritage monuments could be collected to improve the robustness of the model. The model could also be trained on images from different countries and continents to make it more globally applicable.

Integrating with AR/VR technologies: The proposed system could be integrated with augmented reality (AR) or virtual reality (VR) technologies to enhance the user experience. For example, users could point their mobile device at a heritage monument and receive information about it in real-time.

Incorporating Historical Significance: The proposed system could be expanded to include more features, such as the age and historical significance of heritage monuments. This would make the system more informative and would allow users to learn more about the cultural and historical importance of the monuments.

Integration with GIS: The proposed system could be integrated with geographic information systems (GIS) to provide location-based information about heritage monuments. This would allow users to easily locate and navigate to heritage monuments in their vicinity.

Enhancing User Interaction: The proposed system could be improved by enhancing user interaction. For example, users could be allowed to submit their own images of heritage monuments to the system, which would allow the model to continuously learn and improve.

Overall, the proposed system has great potential for further research and development. By expanding the dataset, incorporating historical significance, integrating with AR/VR technologies and GIS, and enhancing user interaction, the proposed system could become an even more valuable tool for aiding the preservation and maintenance of heritage monuments and increasing public awareness and knowledge about these important cultural assets.

***Abstract*— Communicating with differently abled people has always been a challenging task for someone who doesn't understand it and hence sign languages are widely used to break the communication barrier. These are generally used by those with hearing and speaking disabilities to communicate or exchange information with one another as well as other people. Sign Language Recognition involves recognizing and interpreting hand gestures and being able to understand their meaning. There are multiple sign language systems used in different parts of the globe. An application that employs Natural Language Processing and emerging technologies like Computer Vision to translate signs into words has been developed. In this paper, we will be discussing the wide range of development that has taken place in the Indian Sign Language system in order to ease communication between the hearing and speech impaired and the general population.**

Keywords— Sign Language Recognition; Convolutional Neural Networks(CNN); Computer Vision; Artificial Neural Networks(ANN); Support Vector Machines(SVM) ; Indian Sign Language(ISL), Sign Language Recognition(SLR).

I. INTRODUCTION

Sign language is the primary form of communication used by the deaf and mute community inorder to convey their feelings and to pass on messages to the rest of the society. It consists of a variety of hand gestures, arm movements and facial expressions too. There are around 135 types of sign languages being used all around the world, differing only slightly from one another. There is American Sign Language(ASL), British Sign Language (BSL), Australian Sign Language (Auslan), and Chinese Sign Language to name a few. The Indian Sign Language (ISL)system, as outlined on the Talking Hands website, will be the primary subject of this study.[1]. In India alone there are more than 2 million people with hearing disability and they require interpreters who act as a bridge between themand the normal people. However there are very few interpreters and they can be costly resulting in sign language recognition systems to be developed which help solve the purpose. ISL is a visual-spatial language that conveys linguistic information using hand, arm, facial, and head/body motions. Nonetheless, despite ISL's widespread use, it hasn't received much recognition from researchers nor is it recognized as an official language in India. ISL generates both isolated and continuous indications. An isolated sign is a precise hand configuration and attitude expressed by a specific picture that concentrates on a single hand motion and for this the Zernike moments are used.[5] A moving motion portrayedby a sequence of pictures is referred to as a continuous sign.[2] For the continuous hand signs, curve feature vectors are considered to find the unique paths existing. Later, various classifiers such as Support Vector Machines (SVM), Artificial Neural Networks (ANN), Convolutional Neural Networks (CNN) are used to classify the extracted features vectors.

Fig 1. Hand gestures to represent letters in ISL

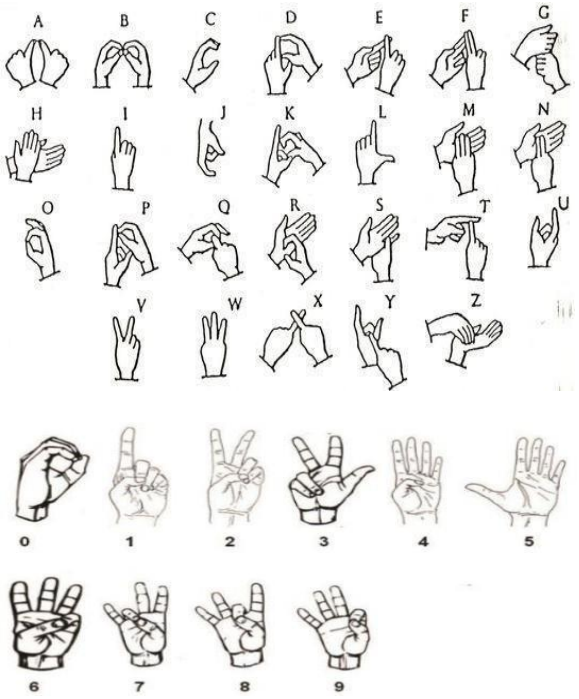

Fig 2. Hand gestures to represent numbers in ISL

The development of a model for the recognition of sign language was primarily driven by two major reasons. The creation of an aiding system for the deaf is the first component. For instance, the creation of sign language papers using a natural device would improve their readability for hearing individuals. Additionally, hearing individuals find it challenging to acquire sign language, and the majority of persons

who were conceived deaf or who turned deaf at a young age have just a small vocabulary of the local language with which they are familiar [3].

Since creating an automated identification system is quite difficult, sign language recognition is an essential study subject. Most American Sign Language(ASL) signs are made with a single hand and are therefore simpler, the majority of studies in this field focus on understanding ASL. The fact that ASL already has usable standardized databases is yet another appealing aspect. Indian Sign Language (ISL) is more dependent on both hands, making an ISL recognition system more complicated [4].

Few of the commonly used sign language gestures usedon a daily basis are shown below.

Fig 3. Commonly used gestures in ISL

II. BACKGROUND

There have been several research and projects focused on Indian Sign Language (ISL) recognition in recent years.

Glove/device-based and vision-based methods are the twomain approaches utilized in the recognition of sign language. To link the gadget to a computer using the glove-based method, the user must wear a device that includes a number of cords. Such technologies are pricey and lessen the naturalness of communicating via sign language. The Vision-based technique, on the other hand, merely needs a camera and focuses on picture motions. Sign capturing and sign analysis are the two steps in the procedure.Vision-based techniques give the user a familiarenvironment and avoid the difficulties associated with glove-based techniques. [2]

Early studies on vision-based hand gesture tracking frequently required the use of vibrant gloves or markers to facilitate image recognition. The innovation in the most advanced vision-based hand monitoring and gesture classification systems now being developed is more concentrated on tracking the raw hand and classifying hand motions without the necessity of markers or gloves. [7]

Two key definitions in the literature on gesture recognition need to be clarified: hand posture and hand gestures. Without any movement, the static hand arrangement and hand position alone describe a hand posture. A hand gesture is a series of hand positions linked together by quick, continual movements. [7]

III. RELATED WORK

There has been significant development in the subject of Sign Language recognition, using unique ways to gesture recognition. In the past, numerous techniques have been used in the field of SLR. A review of numerous existing systems have been made to create a system that is more reliable and effective than the competition.

There are options based on the color of the skin and the color of the glove. Despite having to wear it every time they demonstrate sign language, the multicolored glove allows for correct hand pose reconstruction. Skin-color-based solutions may make use of HSV, YCrCb color space for luminosity invariance or RGB color space with some motion cues. The first few frames of the video sequence were used to train the SVM to recognise variations in skin tone in subsequent frames. However, to quicken the skin segmentation, they applied the Kalman filter to further anticipate the positions of items with skin-colored surfaces, therefore condensing the search field. The YUV and RGB color spaces can be employed for skin segmentation, and the color ranges they've chosen handle the wide variety of racial diversity well.

IV. PROPOSED SYSTEM

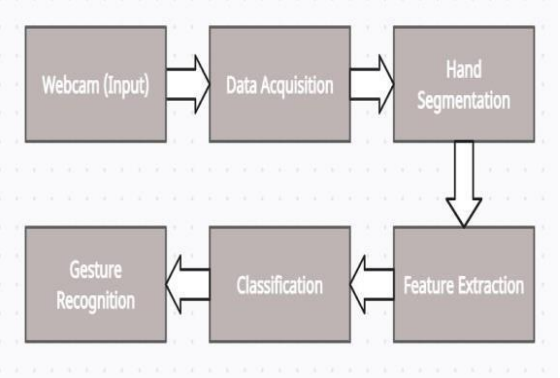

Fig 4. Block diagram of the proposed vision based system

Data Acquisition

Sensing an image is the process of picture acquisition.As a result, lighting senses the image during image acquisition.Pre-processing steps are also a part of it.

In this stage, the user's input gestures are recorded. The camera is needed for motion tracking and data collection because we are employing vision-based technologies to find and identify the gesture. [8]

Hand Segmentation

Image (hand) segmentation's primary objective is the domain-independent division of an image into a collectionof discrete regions that are visually distinct, homogeneous, and meaningful in relation to certain characteristics or computed properties like gray level, texture, or color to facilitate straightforward image analysis. [9]

The majority of the devices here employ cameras to capture images. It processes images and segments them using software like LabView. With the aid of "Vision Assistant Express VI," the photos are pre-processed. [6]

Feature Extraction

By discarding less discriminative data and embedding related information in a compressed representation, feature extraction is a technique for reducing the dimensionality of data.

The palm's center is known as the palm point. The distance transform is used to find this. After the image is transformed into a binary image, the borders of the palm will have pixel values 0, while the hand portion will have pixel values.[6]

Classification

The feature extraction phase's extracted features are used as input in the classification stage. There are numerous different techniques that can be used to identify the movements. Training phase and testing phase make up the classification step. The most significant aspect of digital image analysis is image classification. In our work, we have studied Artificial Neural Networks (ANN), Support Vector Machines (SVM) and Convolutional Neural Network(CNN) to recognise the ISL hand poses and decode their meaning. [10]

Artificial Neural Networks

ANN is a model with natural inspiration that was sparked by the unique cerebral architecture of each person’s character. The supporting elements in a created neural framework are false neurons that mimic real neurons. A synthetic neural network associates fictitious neurons to produce data. It is a well-known machine learning computation for recognition. The ability of the brain system to learn from previous experiences or test designs is a key characteristic. Feed forward neural networks are suggested systems for sign language recognition. Single input layer, single output layer, and multiple hidden layersmake up the network. The neurons in the data layer display the instances to the framework, while the neurons inside the output layers ensure the structure's return. The use of ANN is effective for high accuracy. [10]

Convolutional Neural Network

The strengths of the CNN collection of digital filters are determined during the process of learning. Naturally, the human brain has more intricate processes going on. Each convolutional layer derives attributes from training data using this comparison. A CNN uses convolutional layers, combining learnt attributes with input data to create an architecture that is ideally adapted to processing data. With the aid of numerous hidden layers, CNNs may learn to identify various data features. Every hidden layer makes the features of the understanding data more challenging. The architectural layout of a CNN helps it operate at its best by carefully choosing the number of neurons and convolution layers. There are no agreed standards for choosing the quantity of neurons or convolution layers. Convolution, pooling, and input, output layers are all present in CNN.

Input Layer :

The network's input layer directly applies the pre-processed images to it. The input layer contains 4096 nodes, each of which maps to a single 6464 pixels in the image.

Convolution Layer:

Convolution Layer acts as the foundational component of the CNN and is the initial layer to extract information from an input dataset. The forward and backward propagation used by the kernels in the convolution layer allows them to identify the key features in the input data. The amount of kernels utilized in the convolutional layers might have an impact on how well a CNN model performs. The selection of the kernel count in a convolution layer is not subject to any established standards. Activation functions in a CNN architecture determine which node should be triggered at a given time.

Pooling layer:

A key idea in the deep learning process is pooling. By minimizing the links between the convolutional layers, it speeds up the training process of a CNN and decreases thememory of the network.

Output Layer:

At this layer, the classification model's output, or the projection of a class with a particular probability, is obtained. The Softmax function will return the probabilityof each class in a multiclass classification issue, with the target class having the highest probability. [11]

Support Vector Machines (SVM)

For classification and regression issues, the Support

Vector Machine (SVM) is a supervised model that can resolve both linear and non-linear problems. It functions using the notion of decision planes that define decision boundaries.

SVM with a linear kernel was utilized for this classification. We've given the SVM the histograms of visual words as feature vectors for categorizing and identifying ISL signs. There are 28,800 photos used in total for the training. After training, the classifier's performance is tested on a testing set of 7236 images, and its performance is assessed on a variety of criteria, including recall, accuracy, and other factors.

When classifying using SVM with a linear kernel The algorithm receives a histogram of visual words as feature vectors for categorization and recognition. After the training is finished, the classifier's performance is examined on the testing set and is assessed on a number of criteria, including recall, accuracy, and precision.

The system automatically converts predicted class labels, which are returned as numeric vectors, into text and speech. This is done to improve user convenience and communication. Once the classifier has determined what the label is, it passes it along as a key to a dictionary, which then returns the sign that goes with it as a value. The user is then shown this.

Gesture Recognition

Gesture recognition is the major part of the complete process, images extracted by the camera are fed to the algorithm, features are then extracted and compared with the database. The machine then predicts the image and transmits it in the form of text or voice.

V. CONCLUSION

Disorders like hearing loss or speech impairment have a significant impact on communication. With the help of a smartphone and its capabilities as an assistive technology, communication can be carried out with little trouble. The goal of the research is to eliminate the communication barrier between hearing and non-hearing or mute people. Regardless of whether it was utilized within a home or outside, the system was used to help mute or deaf persons,as well as other people without disabilities, with their daily tasks. It was created as a mobile application so that users may access it at any time, anywhere. These systems are enhanced by additional data gathering, such as interviews with the members of the community. Data analysis is done to further improve the systems to predict sentences via captured gestures.

***Abstract*— Diabetes is a chronic disease with the potential to cause a worldwide health care crisis. According to International Diabetes Federation 382 million people are living with diabetes across the whole world. By 2035, this will be doubled as 592 million. Diabetes is a disease caused due to the increase level of blood glucose. This high blood glucose produces the symptoms of frequent urination, increased thirst, and increased hunger. Diabetes is a one of the leading causeof blindness, kidney failure, amputations, heart failureand stroke. Machine learning is an emerging scientific field in data science dealing with the ways in which machines learn from experience. The aim of this project is to develop a system which can perform earlyprediction of diabetes for a patient with a higher accuracy by combining the results of different machine learning techniques. The algorithms like K nearest neighbour, Logistic Regression, Random forest, Support vector machine and Decision tree are used.**

Keywords— Machine Learning, Diabetes, Decision tree, K nearest neighbour, Logistic Regression, Support vector Machine, Accuracy

I. INTRODUCTION

Diabetes is the fast growing disease among the people even among the youngsters. In understanding diabetes and how it develops, we need to understand what happens in the body without diabetes. Sugar (glucose) comes from the foods that we eat, specifically carbohydrate foods. Carbohydrate foods provide our body with its main energy source everybody, even those people with diabetes, needs carbohydrate. Carbohydrate foods include bread, cereal, pasta, rice, fruit, dairy productsand vegetables (especially starchy vegetables). When we eat these foods, the body breaks them down into glucose. The glucose moves around the body in the bloodstream. Some of the glucose is taken to our brain tohelp us think clearly and function. The remainder of the glucose is taken to the cells of our body for energy and also to our liver, where it is stored as energy that is used later by the body. In order for the body to use glucose for energy, insulin is required. Insulin is a hormone that is produced by the beta cells in the pancreas. Insulin works like akey to a door. Insulin attaches itself to doors on the cell, opening the door to allow glucose to move from the blood stream, through the door, and into the cell. If the pancreas is not able to produce enough insulin(insulin deficiency) or if the body cannot use theinsulin it produces (insulin resistance), glucose builds up in the bloodstream (hyperglycaemia) and diabetes develops. Diabetes Mellitus means high levels of sugar (glucose) in the blood stream and in the urine.

Types of Diabetes

Type 1 diabetes means that the immune system is compromised and the cells fail to produce insulin in sufficient amounts. There are no eloquent studies that prove the causes of type 1 diabetes and there are currently no known methods of prevention.

Type 2 diabetes means that the cells produce a low quantity of insulin or the body can't use the insulin correctly. This is the most common type of diabetes, thus affecting 90% of persons diagnosed with diabetes. It is caused by both genetic factors and themanner of living.

Gestational diabetes appears in pregnant women who suddenly develop high blood sugar. In two thirds of the cases, it will reappear during subsequent pregnancies. There is a great chance that type 1 or type 2 diabetes will occur after a pregnancy affected by gestational diabetes.

Symptoms of Diabetes

- Frequent Urination
- Increased thirst Tired/Sleepiness
- Weight loss
- Blurred vision
- Mood swings
- Confusion and difficulty concentrating
- frequent infections

Causes of Diabetes

Genetic factors are the main cause of diabetes. It is caused by at least two mutant genes in the chromosome 6, the chromosome that affects the response of the body to various antigens. Viral infection may also influence the occurrence of type 1

and type 2 diabetes. Studies have shown that infection with viruses such as rubella, Coxsackievirus,mumps, hepatitis B virus, and cytomegalovirus increase the risk of developing diabetes.

II. BACKGROUND

Vipul Jaiswal uses the classification on diverse types of datasets that can be accomplished to decide if a person is diabetic or not. The diabetic patient's data set is established by gathering data from hospital warehouse which contains two hundred instances with nine attributes. These instances of this dataset are referring to two groups i.e. blood tests and urine tests. In this study the implementation can be done by using WEKA to classify the data and the data is assessed by means of 10-fold cross validation approach, as it performs very well on small datasets,and the outcomes are compared. The naïve Bayes, J48,REP Tree and Random Tree are used. It was concluded that J48 works best showing an accuracy
of 60.2% among others.

Aman Jha aims to discover solutions to detect the diabetes by investigating and examining the patterns originate in the data via classification analysis by using Decision Tree and Naïve Bayes algorithms. The research hopes to propose a faster and more efficient method of identifying the disease that will help in well-timed cure of the patients. Using PIMA dataset and cross validation approach the study concluded that J48 algorithm gives an accuracy rate of 74.8% while the naïve Bayes gives anaccuracy of 79.5% by using 70:30 split.

Dhaiwat Mehta aims to find and calculate the accuracy, sensitivity and specificity percentage of numerous classification methods and also tried to compare and analyse the results of several classification methods in WEKA, the study compares the performance of same classifiers when implemented on some other tools which includes Rapidminer and Matlabusing the same parameters (i.e. accuracy, sensitivity and specificity). They applied JRIP, Jgraft and BayesNet algorithms. The result shows that Jgraft shows highest accuracy i.e 81.3%, sensitivity is 59.7% and specificity is 81.4%. Itwas also concluded that WEKA works best than Matlab and Rapidminner.

III. PROPOSED SYSTEM

In this section we shall learn about the various classifiers used in machine learning to predict diabetes. We shall also explain our proposed methodology to improve the accuracy. Five differentmethods were used in this paper. The different methods used are defined below. The output is the accuracy metrics of the machine learning models.

Then, the model can be used in prediction.

Dataset Description

The diabetes data set was originated from https://www.kaggle.com/johndasilva/diabetes. Diabetes dataset containing 2000 cases. The objectiveis to predict based on the measures to predict if the patient is diabetic or not.

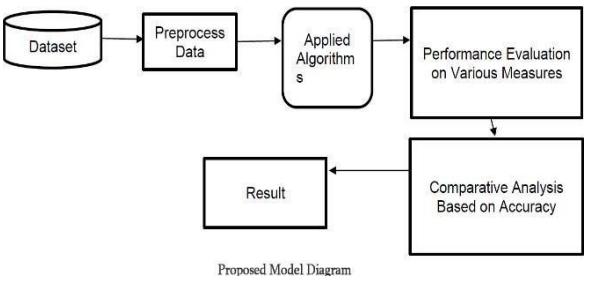
	Pregnancies	Glucose	BloodPressure	SkinThickness	Insulin	BMI	DiabetesPedigreeFunction	Age	Outcome
0	2	138	62	35	0	33.6	0.127	47	1
1	0	84	82	31	125	38.2	0.233	23	0
2	0	145	0	0	0	44.2	0.630	31	1
3	0	135	68	42	250	42.3	0.365	24	1
4	1	139	62	41	480	40.7	0.536	21	0

- The diabetes data set consists of 2000 data points,with 9 features each.
- "Outcome" is the feature we are going to predict, 0means No diabetes, 1 means diabetes.

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 2000 entries, 0 to 1999
Data columns (total 9 columns):
 #   Column                    Non-Null Count  Dtype
---  ------                    --------------  -----
 0   Pregnancies               2000 non-null   int64
 1   Glucose                   2000 non-null   int64
 2   BloodPressure             2000 non-null   int64
 3   SkinThickness             2000 non-null   int64
 4   Insulin                   2000 non-null   int64
 5   BMI                       2000 non-null   float64
 6   DiabetesPedigreeFunction  2000 non-null   float64
 7   Age                       2000 non-null   int64
 8   Outcome                   2000 non-null   int64
dtypes: float64(2), int64(7)
memory usage: 140.8 KB
```

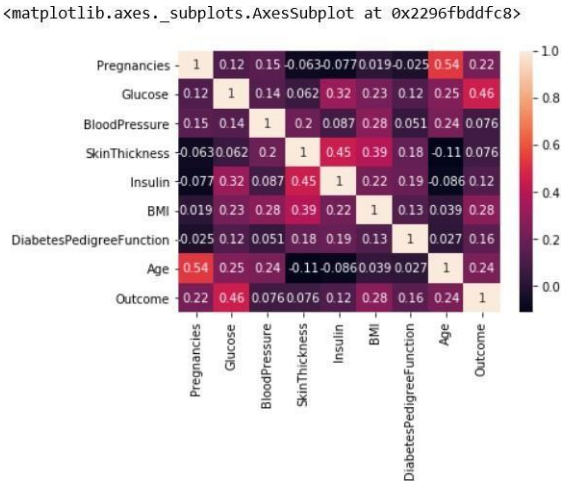
There are no null values in dataset.

- Proposed Model Diagram



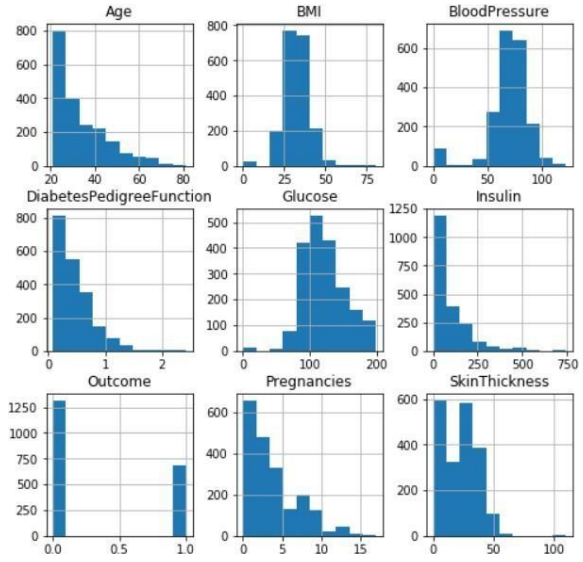
Proposed Model Diagram

- Correlation Matrix



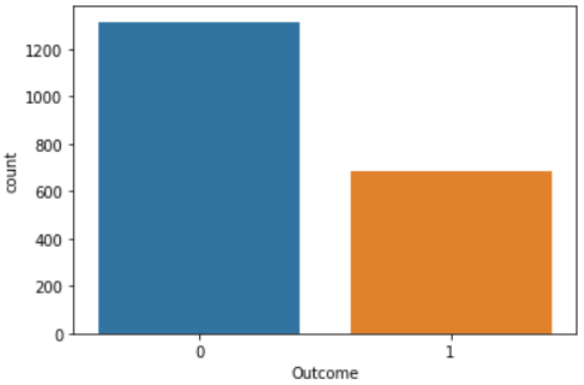
No features are highly correlated with each other.

- Histogram



Let's take a look at the plots. It shows how each feature and label is distributed along different ranges, which further confirms the need for scaling. Next, wherever you see discrete bars, it basically means that each of these is actually a categorical variable. We will need to handle these categorical variables before applying Machine Learning. Our outcome labels have two classes, 0 Let's take a look at the plots. It shows how each feature and label is distributed along different ranges, which further confirms the need for scaling. Next, wherever you see discrete bars, it basically means that each of these is actually a categorical variable. We will need to handle thesecategorical variables before applying Machine Learning. Our outcome labels have two classes, 0 for no disease and 1 for disease.

- Bar plot for Outcome Class

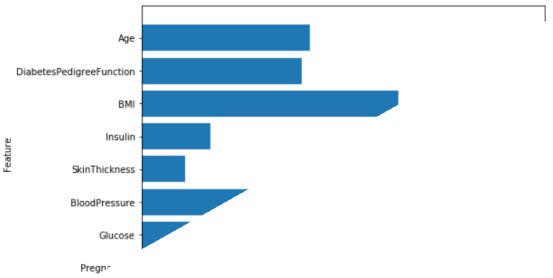


The above graph shows that the data is biased towards datapoints having outcome value as 0 where it means that diabetes was not present actually. The number of non-diabetics is almosttwice the number of diabetic patients.

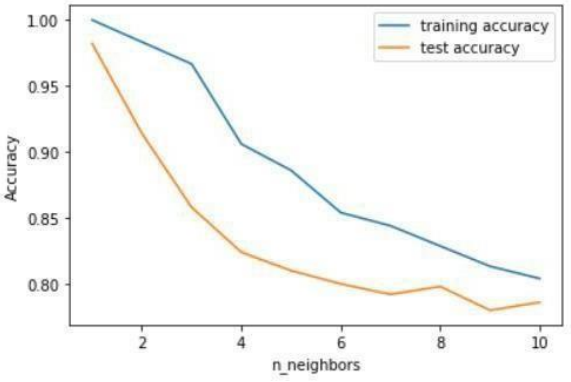
- Proposed Work

For this project specifically, we are using 5 different algorithms.

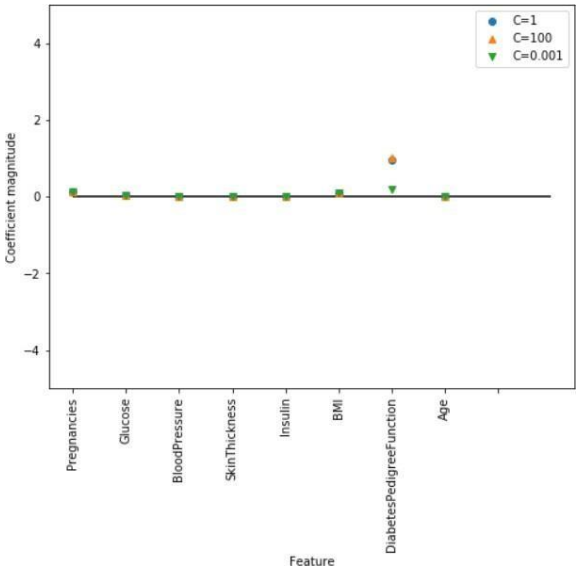
1. Decision Tree: This classifier creates a decision tree based on which, it assigns the class values to each data point. Here, we can vary the maximum number of features to be considered while creating the model.



2. KNN: The k-NN algorithm is arguably the simplest machine learning algorithm. Buildingthe model consists only of storing the training data set. To make a prediction for a new data point, the algorithm finds the closest data points in the training data set, its "nearest neighbors."

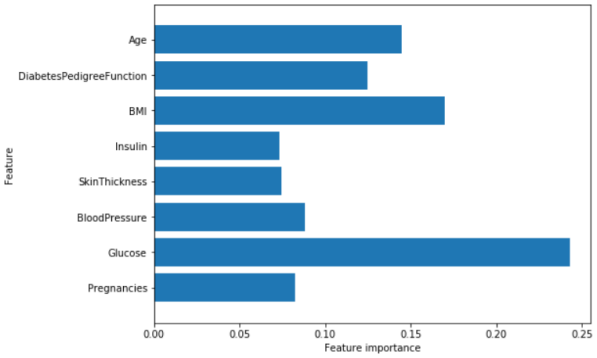


3. Logistic Regression: Logistic Regression is one of the most common classification algorithms.



4. Random Forest: This classifier takes the conceptof decision trees to the next level. It creates a forest of trees where each tree is formed by a random selection of features from the total features.

5. SVM: This classifier aims at forming a hyper plane that can separate the classes as much as possible by adjusting the distance between the data points and the hyper plane. There are several kernels based on which the hyper plane is decided. I tried four kernels namely, linear, poly, rbf, and sigmoid.



IV. RESULT & DISCUSSION

Algorithms	Training Accuracy	Testing Accuracy
k-Nearest Neighbors	81%	78%
Logistic Regression	78%	78%
Decision Tree	98%	99%
Random Forest	94%	97%

Table shows the accuracy values for all five machine learning algorithms.
Table shows that Decision Tree algorithm gives thebest accuracy with 98% training accuracy and 99%testing accuracy.

V. CONCLUSION

One of the important real-world medical problems isthe detection of diabetes at its early stage. In this study, systematic efforts are made in designing a system which results in the prediction of diabetes.
During this work, five machine learning classification algorithms are studied and evaluated on various measures. Experiments are performed on john Diabetes Database. Experimental results determine the adequacy of the designed system with an achieved accuracy of 99% using Decision Tree algorithm.

In future, the designed system with the used machine learning classification algorithms can be used to predict or diagnose other diseases. The work can be extended and improved for the automation of diabetes analysis including some other machine learning algorithms.

Abstract—Hydroponic technology is a niche approach to growing Plantae without soil, using nutrient-rich water and other accouterments to give support for roots. This innovative civilization fashion has a number of benefits when compared with traditional civilization styles, the roots have constant access to an unlimited force of oxygen, as well as access to water. With hydroponics, vegetation can be grown in a controlled terrain, allowing for precise control over growing conditions and optimizing health and productivity. Systems can be designed to make use of perpendicular space which ultimately increases planting viscosity. The capability to grow outdoors allows growers to control temperatures and lighting schedules to ameliorate products. Through a comprehensive literature review and analysis of existing research, we will investigate the effectiveness of hydroponics in terms of crop yields, water usage, and sustainability. Additionally, we will explore the challenges and limitations of hydroponic systems and how they can be overcome. As a result, hydroponics has gained fashionability in both marketable husbandry and home gardening. Overall, presents a sustainable result for icing food security in a fleetly changing world and offers a promising future for husbandry.

Keywords—

I. INTRODUCTION

Agriculture is the process of creating natural resources for financial benefit and human food. Agriculture is one of the oldest and most significant industries and/or professions. It blends innovative product ways and slice-edge technologieswith the creativity, inventiveness, and skills needed for raising creatures and cultivating crops. Traditional farming methods were not producing the expected results, so we had revolution, which enhanced productivity by employing high Yield Variety Seeds and the correct application of fertilizers and pesticides. The world is now demanding more, and we need a new revolution that is fueled by technology and data and produces precise decisions.
Technology for Hydroponic can be applied to agriculture.

hydroponics is the practice of growing plants without the useof soil. In essence, hydroponics is the process of growing plants in a variety of substrates (chemically inert), such as sand, gravel, or liquid (water), without the use of soil. The term comes from the Greek words "hydro" (water) and "ponos" (labor); hydroponics is a soil less method of growing plants while submerging their roots in nutritional solution. This method allows for the growth of plants withoutthe use of soil by using mineral fertilizer solutions. When researchers discovered that soil is not essential for plant growth, they proposed this theory.
Soil has been utilized for centuries because it gives growing plants stability. The majority of the mineral nutrients are also stored in this soil. Further research revealed that water was crucial for the absorption of these minerals because plants acquire mineralnutrients in the form of inorganic ions that are dissolved in water. As the plants are grown in a medium that contains thesolution, the essential minerals are diluted in water.

II. BACKGROUND

1. Edge Device

Although not usually physically connected to an AP or router,edge devices are connected to the internet. They could use PDAs, laptops, or tablets as cellular data connectivity sources that are Wi-Fi or non-Wi-Fi enabled. The gap between your apps and their users is filled by edge devices. Your gadgets can be accessed from anywhere in the globe if they are online. You will always have access to the critical information and apps you depend on, whether you're testing your app from the cramped quarters of an aircraft seat or reading your emails from a beach home in Hawaii.

This edge cloud is not intended to replace centralized cloud- based infrastructure in its entirety, but rather to complementit by increasing the computing and storage resources available on the edge by adopting platforms that provide intermediate layers of computation, networking, and storage.[1]

2. Problems in Traditional Hydroponics

Growers that use hydroponics must deal with several issues. The first issue is the scarcity of nutrients in the natural world. Numerous nutrients are either non-renewable or gradually lose their availability. As a result, there are shortages, which raise prices and reduce the number of merchants that offer them. The quantity, pH level, and light intensity of other nutrients vary. This makes it more challenging to set up a farm since each plant has varied nitrogen and trace elementrequirements. Last but not least, because hydroponics uses enormous amounts of water daily, water shortage is a typical problem. Discovering a system that works best for your develop is crucial for this reason. Keep in mind that your crop will develop more successfully the better the growing environment.

III. RESULT AND DISCUSSION

A . Seedling problem

Growing a healthy seedling is one of the most difficult processes in hydroponics since seedlings are susceptible to issues during their early growth stage. Wilting is a

conditionwhen a plant loses its stiffness and its leaves begin to dry up. It can be brought on by a number of circumstances, includinginadequate watering or extreme temperatures. It is not an illness, but rather a sign of another issue. By carefully pushing up on the plant and looking for damage or rotting, you may determine whether your plants' roots are healthy if you observe them drooping. If the roots are unharmed, you might need to boost watering or offer shade during hotweather. Dead roots can occur for a variety of causes, including overwatering in thick soils, extremely high or extremely low EC, and others. Dead roots may potentially indicate the presence of the root rot pathogen in the system.

B. Infestation Problem

No matter how well gardeners run their hydroponic crops, infection cannot be stopped. During the early stages of an infestation, you can take a few actions. You should first determine whether a pest is to blame for the issue. This is dueto the fact that some insects are harmless to hydroponic farms. Algae can lead to blockage in the hydroponic system,changing the way nutrient solution is circulated generally. Algae can also absorb nutrients from the fluid at the same time, altering the plant's growth and development. Algae typically bunches together and is green or brown in hue. Algae can be observed as floatable particles or thin layers onthe water's surface when there is plenty of sunshine and warmth, such in the summer, algae tends to develop quickly.

C. Nutrient Deficiency

The gardener often determines a specific nutrient deficit by examining the symptoms, however this can occasionally be deceptive. You should examine the water temperature, nutrition solution pH, and solution EC before verifying a problem. If every reading is at its ideal level, you should examine the solution's nutritional makeup.

IV. LIMITATIONS OF SOIL-LESS CULTURE

Although soil-less culture has many benefits, it also has significant drawbacks[2]. Although there are significant upfront costs associated with commercial application, the returns are tremendous. Because it is so expensive, soil-less cultivation is only used for high-value crops. Regarding plant health control, extreme caution is needed. Last but not least, the system needs energy inputs to function.[3].

V. FUTURE SCOPE OF THIS TECHNOLOGY

Agriculture's fastest-growing industry, hydroponics, may eventually control how food is produced. People will turn to innovative technologies like hydroponics and aeroponics to generate extra channels of crop production when populationrises and arable land shrinks as a result of poor land management[4]. We simply need to look at a few of the earlyadopters of this techniqueto gain a sense of hydroponics' future. Land in Tokyo is quite expensive because of the city's expanding population. The nation has shifted to hydroponic rice production to feed the populace while protecting vital land mass[5]. Without using any soil, the rice is harvested in underground vaults. As a result of the environment's absolutecontrol, four harvest cycles rather than the usual one can becarried out each year.

Many participants in the Emirates economy in Abu Dhabi take the planting of palm trees seriously. The climate in the Emirates of Abu Dhabi, which has many desert-like qualities,is suitable for cultivating palm trees.

Abu Dhabi has a large proportion of fruit plants that arepalm trees, thus implementing this cost-effective irrigation technique in its plantation would help the government in thiscommercial metropolis conserve a lot of water and energy. When it comes to irrigation and producing high-quality agricultural products for domestic and international consumption, hydroponics has proven to be quite effective.

In the scientific community, there has already been a lot of discussion about the possible utility of hydroponics in third- world nations with scarce water resources.[3-5].

VI. CONCLUSION

Future industry growth is anticipated to be exponential as soil conditions for growing become more challenging. Thereis no other choice but to adopt soil-less culture to helpimprove the yield and quality of the produce in order to ensure food security for our nation, particularly in a countrylike India where urban concrete conglomerate is growing every day. However, the deployment of this technology may be accelerated by government action and research institute interest.

***Abstract*— M-Health has successfully transformed conventional healthcare delivery, enabling a sizable portion of the population to quickly access facilities using a connected mobile device. The study on the adoption of M-Health apps among smartphone users is crucial at this point for the Marketers and consumers. When using health apps, emotional decision-making has the upper hand. The goal of the current study is to comprehend the psychological considerations that consumers have when utilizing a health app. Instead of being motivated by rational thought, consumers are motivated by emotional needs such as the capacity to getinformation whenever they need it, minimize their own healthcare expenditures, and have easy access to doctors. This study creates a structural equation model based on a framework for the value chain of digital content and highlights the key benefits of mHealth apps.This study confirms, from a fresh angle, the potential of mHealth apps to enhance public health governance and offers a fresh theoretical framework for how mobile technology may aid in this improvement.**

Keywords— M-Health App, M-Healthcare,Healthcare on Mobile device

I. INTRODUCTION

The use of mobile internet devices (MIDs), smartphones, and proprietary software applications (also known as "apps" in short) can improve communication among medical caregivers[1][2]. Wani *et al*. have highlighted the efficacy of communication using WhatsApp in plastic surgery. We would like to elaborate upon a wider scope of usage of theseMIDs in improving health care as well as medical education.

It has been demonstrated that mobile technology and mobile devices can be used effectively in public health governance. Mobile health (mhealth) refers to the provision of medical and public health services to the general public via mobile phones, patient testing equipment, personal digital assistants, and other wireless devices. Currently, mhealth primarily offers services via smartphone apps. The availability of health services has changed as a result of the development of mHealth apps, which has benefited both patients and providers. On the one hand, mhealth apps are used by doctors to process patient data and keep track of their health. On the other hand, people use mhealth apps to get information about their health and get a quick diagnosis.

Traditional healthcare services are digitized and made available to users via the Internet by mobile health apps. The impact of mHealth apps' digital content (DC) value on society is reflected in their role in public health management during the COVID-19 pandemic. It is anticipated that mobile health apps will play a significant role in the COVID-19 pandemic . As a result, numerous studies have shown that using m-health apps to treat COVID-19 has significant functional benefits. The COVID-19 pandemic is currently reoccurring, overwhelming public health services and maintainingmomentarily high pressure on public health governance. Additionally, the use of m-health apps enables patients to easily obtain health information and receive medical care, reducing hospital visits and limiting population mobility in high-risk areas [2,3,4]. Patients' ability to monitor and respond to diseases is enhanced by mobile health apps.

Due to a triad of technological, social, and economic issues, smart agricultural systems have yet to be practically realised, deployed, or adopted. The mainstreaming of smart agriculture could be made possible through edge computing.

Establishing food security remains a global challenge; it isthus a specific objective of the United Nations Sustain- able Development Goals for 2030. Edge computing can bethought of a key factor in achieving this objective

II. BACKGROUND

1. The Rise of mHealth Initiatives

There has been an explosion of mHealth activities around the world. A 2011 global survey of 114 nations undertaken by the World Health Organization found that mHealth initiatives have been established in many countries, but there is variation in adoption levels.[3] The most commonactivity was the creation of health call centers, which respond

to patient inquiries. This was followed by using SMS for appointment reminders, using telemedicine, accessing patient records, measuring treatment compliance, raising health awareness, monitoring patients, and physician decision support.

2. Main values of m-healthcare app during COVID -19

- During the COVID-19 pandemic, the provision ofeffective medical protection was the most significant functional value that mhealth apps added. Prior to the appearance of COVID-19, mobile health apps were not particularly well-liked [4]
- However, the public health department has been encouraging patients to avoid face-to-face medical services as much as possible due to the rising prevalence of COVID-19 in order to efficiently utilize limited public health resources and prevent cross-infection [3]. As a result, mhealth apps have become increasingly popular in a number of nations for patient consultation, monitoring, and care. Remote medical consultation, psychological consultation, health education, and medical protection can all be achieved through the use of mobile health apps that enable the exchange of two-way data between patients and healthcare providers. It meets the medical necessities of the user. User intentions can be positively influenced bysatisfying utilitarian needs [4,5]. Through frequent interactions with mhealth apps, users are required to satisfy utilitarian medical needs.

- Confidence is the most significant emotional value that mHealth apps generate. Users' satisfaction with mhealth apps and their intentions to continue using them during the COVID-19 pandemic are positivelyinfluenced by the apps' capacity to instill confidencein their users [6,7]. The COVID-19 pandemic may result in mental health issues. New coronary pneumonia, which is more likely to cause depression, anxiety, insomnia, and other negative emotions, has not been specifically treated with a medication. As a health information platform, mhealth apps can provide users with psychological support and positive health information [8.9]. For instance, they can explain the pathogenesis of COVID-19 and the dynamics of the government and related organizations' epidemic prevention strategiesto dispel users' skepticism and boost their confidence.
- A positive doctor-patient relationship is one example of the social value of mhealth apps during the COVID-19 pandemic [8,9]. Because they are passive during face-to-face diagnosis and treatment, patients frequently experience pressure. Patients have the impression that they are in charge in telemedicine, which lessens the pressure to see a doctor [8,9]. Medical services in an information network environment have been shown to be more patient-centered in a number of studies [. This makes it easier for patients and doctors to worktogether and makes them both happier.

III. Research Model and QuestionnaireSurvey

3.1. Digital Content-Value Chain Framework

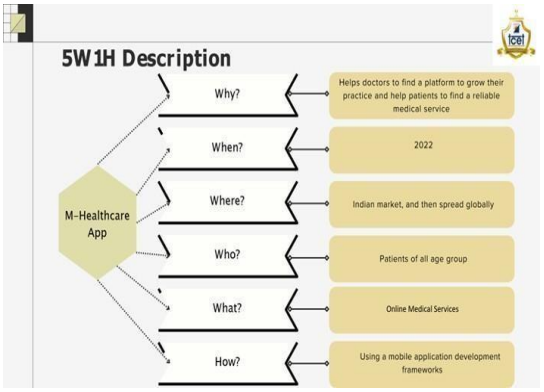
This study proposes a research model of the mhealth app value chain during the COVID-19 pandemic. The model shows that an mhealth app transfers the value created by itself to public health governance through interactions with users. Mobile health apps do not directly affect public health governance during the COVID-19 pandemic as an auxiliary medical mobile phone app, but they can provide users with functional (healthcare assurance), emotional (patient healthcare confidence), and social(patient–patient relationship) values that promote theinteractions between users and mhealth apps, meet medical needs, increase confidence in health management, and establish a harmonious doctor–patient relationship, thereby increasing users’satisfaction with the COVID-19 public health governance.

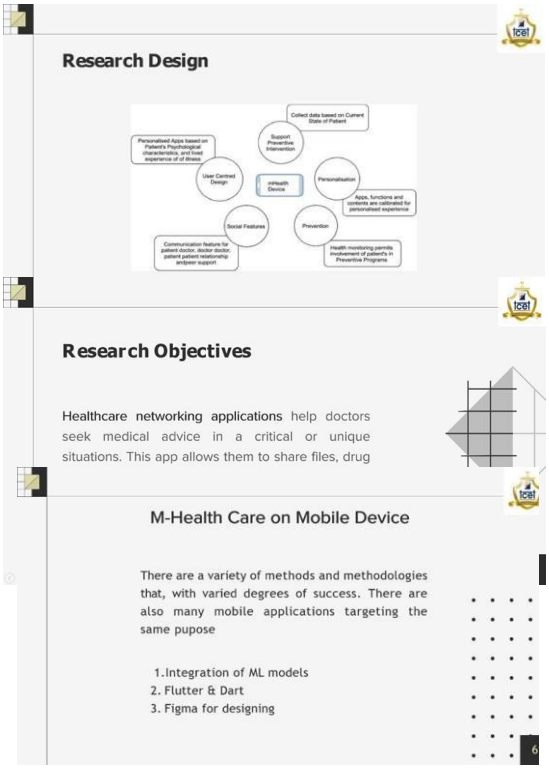
IV. Methodologies

There are two kinds of structural equation models (SEMs): the covariance-based CB-SEM and the variance-based VB-SEM. The software package Smartpls3.0 and the VB-SEM partial least squares SEM (PLS-SEM) were utilized in this study. The second-generation multivariate data analysis technique known as PLS-SEM is mostly used for exploratory theoretical research. All relationships between independent and dependent variables can be preserved using this approach [10]. (1) PLS-SEM is better suited for models with more than six variables than CB-SEM [11]; 2) PLS-SEM

is effective for processing data from small samples [11]; (3) Data with non-normal distributions can be processed by PLS-SEM [11]. In conclusion, the theoretical development stage is better suited to the PLS-SEM method than the CB-SEM stage. It has also been demonstrated that the PLS-SEM method can replace the CB-SEM in the majority of social science researchcases [11] and is widely used in social, economic, andbusiness research.

Using a network calculator (http://www.biosoft.hacettepe.edu.tr/MVN/, accessed on 3 January 2022), a multivariate normality analysis was carried out on the data. Mardia's multivariate skewness was found to be 75.184, p 0.01, and the multivariate kurtosis was found to be 788.253, p 0.05, indicating multivariate non-normality. In addition, this study has seven variables. PLS-SEM is therefore appropriate for this study's data analysis.





V. Results

Through the user's satisfaction with public health governance after using mhealth apps, this study measures the impact of the value created by mhealth apps on public health governance during the COVID-19 pandemic. To find out if there is a difference in how satisfied people are with public health governance, it is necessary to conduct a surveyof people who have or have not used mhealth apps. If there is no difference, further investigation is unnecessary because there is no value transfer caused by mHealth apps.

An independent sample t-test is used in this study to compare the satisfaction of 316 people who have used mhealth apps with that of 172 people who have not. Table 2 summarizes the findings. When it comes to public health governance during the COVID-19 pandemic, users who have used mhealth apps are significantly more satisfied on average than those who have not.

VI. Discussions and implications

This study confirms that the functional value of the DCproposed by Kim and Kim [12] promotes and expands user–system interactions by demonstrating that the healthcare assurance value created by mhealth apps had a positive impact on user–function, user–information, and user–doctor interactions. This indicates that during the COVID-19 pandemic, the healthcare assurance value created by mhealth apps for users also actively encourages interactions between users, information, and doctors in mhealth apps. Under the current circumstances, mhealth apps are complex and comprehensive health management apps. In addition, it is incorporated into a number of services, including health monitoring, appointment registration, online diagnosis, drug purchase, and health knowledge search,among others [5]. Each function interacts with users to improve total healthcare assurance. It is necessary to complete it, from health monitoring (user–function interactions) to online diagnosis (user–doctor interactions) and self-health management (user–information interactions) through mhealth apps, especially in the event that there are insufficient medical resources and limited travel during the
COVID-19 pandemic. Under the intermediary roles of user–function interactions, user–information interactions, and user–doctor interactions in this study,it also confirms that

the healthcare assurance value created by mhealth apps enables users to improve their satisfaction with public health governance. This also demonstrates that during the COVID-19 pandemic, users used mhealth apps (DC–value interactions) to convert the DC creation value they received from mhealth apps into their satisfaction with public health governance. During the COVID-19 pandemic, it also encourages interactions between users and mHealth apps and contributes to their increased involvement in healthcare assurance and public health governance.

The interactions between users and functions, information, and doctors are all improved by healthcareconfidence value. The study's findings demonstrate the emotional value of DC in expanding relationships and facilitating interactions between users and content.

During the COVID-19 pandemic, the value of mhealth apps in actively promoting the functions of users and mhealth apps as well as the interactions between doctors is referred to. Confidence boosts user participation and enhances the quality of interactions with mHealth apps . During the COVID-19 pandemic, users will make every effort to interact with mhealth apps because they are confident in their ability to manage their health. In addition, it demonstrates that, as a result of the mediation effect of these interactions, users of mhealth apps are able to increase their level of satisfaction with public health governance in the study. The findings indicate that during the COVID-19 pandemic, users' satisfaction with public health governance is correlated with the healthcare confidencethey gained from mHealth apps (DC use values).

During the COVID-19 pandemic, mhealth apps will be able to play a larger role in public health governance byimproving the various interactive experiences between users and mhealth apps.

The user-doctor interaction relationship and the parasocial relationship values created by mHealth apps are significant in this study. In accordance with the Kim and Kim [12] study, this result confirmed that the social value of DC encourages user-to-user interactions. This indicated that the parasocial relationship can improve emotional attachment for doctors and reduce users' inherent prejudice. Users tendto be satisfied with their doctor's treatment and have a favorable opinion of doctors thanks to the parasocial relationship. Lastly, it may make interactions between users and doctors easier. Under the mediation effect of user–doctor interactions, this study found that mhealth app-created parasocial relationships improve users' satisfaction with public health governance. This indicates that during the COVID-19 pandemic, users will transform the parasocial relationship achieved by mhealth apps into satisfaction with public health governance. During the COVID-19 pandemic, mhealth apps will be able to play a greater social role in enhancing doctor–patient relationships in public health governance by improving the interactive experience between users and the apps.

VII. Conclusion and future work

It is believed that providing ubiquitous healthcare solutions on Android™ mobile devices can have a significant impact on heart rate management and ECG monitoring for patients in their everyday lives.

Technological advancements have greatly increased ourdiagnostic capabilities, leading to widespread acceptance and increased expectations for high-quality healthcare services. Regular monitoring of chronic diseases with proper medication care and guidance can lead to effective disease control. Wireless Sensor Networks (WSNs) can reduce the hassle of traditional wired ECG machines, provide clean and stable signals for real-time heart rhythm analysis, and achieve self-monitoring, mobility, and flexibility, which can help move healthcare from clinical-centric to patient-centric and from treatment to prevention.

Personalized medicine care assistance in the healthcare system can provide a more comprehensive and affordable healthcare solution to the patient, assisting with medication administration without the need for additional hardware devices and costs. The proposed solution only requires an ultra ECG wearable device embedded with a sensor node and an Android™ smartphone device, and additional health parameters such as blood pressure, blood glucose level, and body temperature can be included in the system for more precise monitoring. An alarm system can also be addedto the system to send warning messages wirelessly to adoctor's mobile phone if an event occurs. GPS capability can be used to easily track the patient's location if rescue is needed.

VIII. Acknowledgements

It would be unfair to not acknowledge the help and support given by the Professors, students, friends etc.A sincere thank you to the guide and mentor Mrs.
Sampada Bhonde for her guidance and constant support. Immense gratitude is offered to the HOD, Dr.Megharani Patil, the Principal, Dr. B. K. Mishra and the college management for their support.

***Abstract*— A voting website for disabled people would aim to provide a platform that is accessible and user-friendly for individuals with disabilities. This website would be equipped with features such as large font options, high contrast displays, screen reader compatibility, and alternative input methods (e.g. keyboard navigation instead of mouse-clicking) to accommodate various disabilities such as visual or mobility impairments. It would also provide information about voting processes and procedures, as well as resources for support and assistance in the voting process. Additionally, the website could offer the option for disabled individuals to request accommodations or assistance with voting, such as curbside voting or accessible voting machines. The website would strive to educate the public on the barriers that disabled individuals face in the voting process and advocate for policies to address these issues. By ensuring that disabled individuals have equal access to the voting process, the website aims to promote a more inclusive and democratic society. The ultimate goal of this website would be to promote greater accessibility and inclusivity in the electoral process for disabled individuals.**

Keywords — Accessibility, Visual Impairments, MobilityImpairments, Assistance, Text-to-speech, ARIA (Accessible Rich Internet Applications), Assistive Technologies, Inclusive Design Principles, Electoral process.

I. INTRODUCTION

As a society, it is crucial that everyone has equal opportunities and access to participate in the democraticprocess. Voting is a fundamental right and an essential aspect of democracy, and it should be accessible to all citizens, including those with disabilities. That's why it's important tohave voting websites for disabled individuals.

Despite the efforts to make voting accessible, manydisabled individuals still face physical barriers that prevent them from participating in elections and political processes. By providing a platform for online voting, disabled individuals can cast their votes from the comfort of their ownhomes or other convenient locations, eliminating the need forthem to physically go to polling stations.

These websites are designed to provide an accessible and inclusive platform for citizens with disabilities to exercise their right to vote. They feature options such as alternative text, audio descriptions, and easy-to-use interfaces that accommodate individuals with a wide range of disabilities. Inaddition, these websites may provide resources and information about accessible voting practices, assistive technology, and accommodations for individuals with disabilities during the voting process.

In this paper, we will delve into the importance of accessible voting for disabled individuals and the various features and resources available on voting websites for disabled individuals. We will also discuss the efforts being made to ensure that everyone, regardless of ability, can participate in the democratic process and have their voices heard.

It's time to break down the barriers that prevent disabled individuals from exercising their right to vote. With accessible voting websites, we can take a step towards a more inclusiveand democratic society.

II. BACKGROUND

The background of voting websites for disabled individuals is rooted in the desire to increase accessibility and inclusivity in the democratic process. Historically, individuals with disabilities have faced barriers in participating in the voting process, such as inaccessible voting booths, insufficient accommodations, and lack of assistive technology. This has resulted in a significant underrepresentation of disabled individuals in the political process.

To address these barriers, the Americans with Disabilities Act (ADA) was passed in 1990, which requires all polling placesto be physically accessible to individuals with disabilities.

However, despite these efforts, many disabled individuals still face challenges in the voting process.

In response to these ongoing challenges, voting

websites for disabled individuals were developed to provide an accessibleplatform for disabled citizens to cast their votes. These websites often feature options such as alternative text, audio descriptions, and easy-to-use interfaces to accommodate individuals with a wide range of disabilities. Additionally, these websites may provide resources and information about accessible voting practices, assistive technology, and accommodations for individuals with disabilities during the voting process.

The goal of voting websites for disabled individuals is to ensure that all citizens, regardless of ability, have equal opportunities to participate in the democratic process and have their voices heard. This is an important step towards a more inclusive and democratic society, where everyone has the right to express their opinions and shape the future of their communities and country.

III. METHODOLOGY

When developing an online voting platform for disabledindividuals, the first step should be to conduct research into the digital literacy levels and assistive technology needs of the target demographic. This will help to determine the specific features that need to be included in the platform to ensure that it is accessible.

Once the features have been identified, the next step should be to develop the platform. This should involve creating an intuitive user interface, incorporating the necessary security measures, and ensuring that the platform is compatible with different assistive technologies. Additionally, measures such as simplified language, clear instructions, and adjustable userinterfaces can help to make the platform more accessible.

Once the platform is ready, it should be tested to ensure that it is secure, intuitive, and accessible for disabled users. This can involve user tests, usability testing, accessibility testing, and security testing.

Finally, the platform should be made available to the target demographic, and feedback should be collected to ensure thatthe platform is meeting its goals.
An online voting platform for disabled individuals can be created by following the following methodology:

Research and understand the needs and requirements of disabled individuals: This involves gathering information about the types of disabilities that individuals may have and how they may impact their ability to use an online voting platform.

Design an accessible interface: The interface should be designed with accessibility in mind, using clear and simple language, high-contrast color schemes, and large font sizes. It should also be usable with assistive technologies such as screen readers.

Implement security measures: The platform should implement security measures to prevent fraud and ensure theconfidentiality and integrity of the voting process. This may include encryption, secure authentication methods, and regular security audits.

Provide alternative methods for casting votes: The platform should provide alternative methods of voting for individuals with disabilities, such as phone or mail-in voting, to ensure that everyone has an equal opportunity to participate.

Test and refine the platform: The platform should be tested with a diverse group of individuals with disabilities to identify and fix any accessibility or usability issues. The platform should be refined based on feedback from users.

Provide support and resources: The platform should provide support and resources for individuals with disabilities who may need assistance in navigating the platform or casting their votes. This may include a support hotline, online resources, and in-person support at voting locations.

Continuous improvement: The platform should be continuously improved based on feedback from users and evolving accessibility standards to ensure that it remains accessible and usable for disabled individuals.

IV. RELEVANT LITERATURE

Studies have found that disabled people are traditionally lesslikely to participate in political and civic activities due to physical and social barriers, such as inaccessible polling centers and lack of information. However, with the introduction of online voting websites, these barriers can be overcome.

Research has highlighted the positive effects of online votingwebsites for disabled individuals. For instance, a study conducted at Ohio State University found that online voting platforms increased voter turnout amongst disabled people. Another study conducted by the University of California LosAngeles, found that online voting websites improved the accessibility of the voting process, making it much easier for disabled people to participate in the electoral process.

Furthermore, online voting websites have been found toprovide disabled individuals with more autonomy and control over the voting process. For example, a study conducted by the University of California Berkeley found that online voting websites enabled disabled people to vote without assistance from family members or caretakers.

There is a growing body of literature on the development of online voting platforms for disabled individuals. Here are some relevant research papers and articles that may be usefulin developing a voting website for disabled people:

"Designing an Accessible Electronic Voting System for People with Disabilities" by J. Scardino and L. Bailey, which provides a comprehensive overview of the design considerations for an online voting platform that is accessible to individuals with disabilities.

"E-Voting for People with Disabilities: A Review of CurrentResearch and Practice" by J. Scardino, which reviews the current state of research and practice in the area of electronic voting for disabled individuals, including the design of accessible online voting platforms.

"Making E-Voting Accessible for People with Disabilities: Lessons Learned from the Field" by A. Crouch and J. Scardino, which provides practical lessons and insights fromreal-world experience in the development of accessible online voting platforms.

"Design and Evaluation of an Online Election System for People with Disabilities" by L. A. Redish, C. Looney, and J.Teixeira, which describes the design and evaluation of a prototype online voting platform that is accessible to disabledindividuals, including the implementation of accessibility features such as keyboard navigation and audio instructions.

These research papers and articles can provide valuable information and guidance on the design and development of an online voting platform that is accessible to disabled individuals. Additionally, organizations such as the World Wide Web Consortium (W3C) and the International Association of Accessibility Professionals (IAAP) provide information and guidance on web accessibility standards andbest practices that can be used in the development of an online voting platform.

V. CHALLENGES AND LIMITATIONS

There are several challenges and limitations in the development of an online voting platform for disabled individuals, including:

Technical difficulties: Ensuring the accessibility and compatibility of the platform with various assistive technologies, such as screen readers, magnifiers, and alternative input devices, can be technically challenging.

User experience: Designing an accessible platform that is user-friendly and intuitive for disabled individuals can be difficult, as user preferences and needs may vary widely.

Legal and regulatory issues: Compliance with accessibility regulations and standards, such as the Web ContentAccessibility Guidelines (WCAG), can be challenging, particularly in ensuring that the platform is accessible to individuals with a wide range of disabilities.

Security and privacy: Ensuring the security and privacy of thevoting process and personal information of disabled voters can be a major challenge, particularly in the context of onlinevoting.

Cost: Developing and maintaining an accessible online voting platform can be expensive, particularly in terms of the cost of implementing accessibility features and ensuring ongoing compatibility with assistive technologies.

Awareness and education: Raising awareness of the need foraccessible online voting platforms among disabled individuals and policymakers can be a challenge, as well as providing adequate education and support to disabled voters on the use of the platform.

Digital Literacy: People with disabilities may have lower levels of digital literacy and may not be able to navigate the platform easily. This could be addressed by providing clear instructions and simplifying complex tasks.

Assistive Technology: People with disabilities may require the use of assistive technology to access the platform. This could involve providing alternative input devices, providing audio options, or making the user interface customizable.

Security: To ensure that the user's data is kept safe, the system should incorporate measures to protect against potential security threats. This could involve implementing strong authentication methods, encryption, and other securitymeasures.

Accessibility: The platform should be designed to be accessible for people with various disabilities. This could involve using simplified language, providing clear instructions, and making the user interface adjustable.

These challenges and limitations highlight the need for continued research and development in the area of online voting platforms for disabled individuals, in order to design and implement effective, user-friendly, and secure platformsthat are accessible to all individuals, regardless of ability.

VI . PROPOSED SYSTEM

An online voting platform for disabled individuals can be designed with accessibility and usability as top priorities. It can include the following features:

Screen reader compatibility: The platform should be compatible with screen reader software, allowing visually impaired users to access the platform and cast their votes.

Keyboard navigation: The platform should be designed to be navigable using only a keyboard, making it easier for individuals with physical disabilities to use the platform.

Customization: The system should allow for the customization of the user interface based on the individual'sdisability. This could involve making the text size adjustable,providing audio options, allowing users to choose their preferred color palette, or allowing them to access the systemusing alternative input devices.

Security: Due to the sensitive nature of the information being shared, the system should be protected against potential security threats. This could involve implementing strong authentication methods, encryption, and other securitymeasures.

Data Protection: To ensure that the user's data is kept safe, the system should incorporate measures to ensure that no unauthorized individuals have access to it. This could involve using data anonymization techniques, using secure data storage solutions, and incorporating access control measures.

Ease of Use: The system should be designed with ease of usein mind. This could involve using simplified language,providing clear instructions, and simplifying complex tasks. Large text options: The platform should provide options forincreasing the size of text, making it easier for individuals with visual impairments to read the content on the platform.

Audio instructions: The platform can also provide audio instructions to help guide users through the voting process, making it easier for individuals with visual and physical disabilities to use the platform.

By incorporating these accessibility features, an online voting platform can ensure that disabled individuals are able to exercise their right to vote and participate in the democratic process.

VII. RESULTS AND DISCUSSION

The results and discussions surrounding the implementation of an online voting website for disabled individuals are interrelated and crucial to ensuring the success and impact ofthe platform. Some of the key outcomes and discussions include:

Increased voter turnout: Online voting provides a more accessible and convenient option for disabled individuals, which can result in higher voter turnout among this group. However, discussions about the security and accuracy of thevoting process are also important to ensure that the platform is trustworthy.

Improved accessibility: The online voting platform can be designed to accommodate the needs of individuals with disabilities, making it easier for them to participate in elections. Discussions about the user experience and providing alternative methods of navigation, such as keyboard-only options, are important to ensure the platform is accessible and usable for all individuals.

Enhanced privacy: Disabled individuals may feel more comfortable voting in private, without the need for assistanceor the fear of being seen by others. An online voting platform can provide this level of privacy. Discussions about thesecurity of the platform and the privacy of voters' informationmust be a top priority.

Increased engagement: By providing disabled individualswith the means to participate in elections, the online voting platform can encourage increased political engagement among this group. However, discussions about voter education and providing clear instructions are important to ensure that disabled individuals understand how to use the platform and participate fully.

Reduced barriers to voting: The online voting platform can eliminate physical barriers that may prevent disabled individuals from participating in elections, such as the need to travel to polling stations or access ramps. However, discussions about the cost of developing and implementing the platform must be taken into consideration.

Increased trust in the democratic process: By providing an inclusive and accessible platform for disabled individuals to participate in elections, the online voting website can help toincrease trust in the democratic process. Discussions about public acceptance and education about the benefits of online voting are important to increase support and acceptance of theplatform.

Overall, the results and discussions surrounding the implementation of an online voting website for disabled individuals highlight the importance of ensuring the platform is accessible, secure, user-friendly, and cost-effective fordisabled individuals. By addressing these issues and ensuringthe platform is inclusive and empowering, we can create a platform that truly serves all citizens and promotes equal participation in the democratic process.

VIII. CONCLUSION

In conclusion, creating an online voting website for disabledpeople is a crucial step towards promoting accessibility and inclusivity in the electoral process. This platform can provideindividuals with disabilities

the opportunity to participate in the democratic process in a convenient and accessible manner. It can also help reduce barriers such as physical mobility and long lines, making voting more accessible and efficient for all.

Additionally, implementing features such as easy-to-use interfaces, clear and simple instructions, and accessibility tools such as screen readers, can greatly enhance the user experience for disabled individuals. To ensure the security and credibility of the voting process, the website can implement strong security measures and follow best practicesfor online voting systems.

In short, the development of an online voting website for disabled people can have a positive impact on the democraticprocess by providing equal opportunities for participation and enabling everyone to have a voice in shaping their communities and nation.

IX. FUTURE SCOPE

The future scope for voting websites for disabled individuals is quite promising and holds a lot of potential for increasing accessibility and inclusiveness in the voting process. Here are some possible directions for future development in this field:

Increased Use of Assistive Technologies: With advancements in assistive technologies, it will be possible toprovide more accessible and user-friendly interfaces for disabled voters. For example, the use of speech recognition and synthesizer technologies can help individuals with visualor mobility impairments.

Improved Usability Testing: To ensure that voting websites are accessible and inclusive, it is important to conduct extensive usability testing with disabled individuals. This canhelp to identify and address any barriers to accessibility and inclusiveness and improve the overall user experience.

Integration with Assistive Devices: Voting websites can be integrated with assistive devices, such as screen readers, magnifiers, and alternative input devices, to make the votingprocess more accessible and inclusive.

Increased Security and Verifiability: With the growing concern over the security and verifiability of online voting systems, it is important to ensure that voting websites for disabled individuals are secure and transparent. This can be achieved through the use of secure protocols and the implementation of auditable voting systems.

Expansion to Developing Countries: While progress has beenmade in developed countries, there is still much work to be done to make voting accessible and inclusive for disabled individuals in developing countries. The future scope for voting websites for disabled individuals should include efforts to expand access to these systems in developing countries.

Overall, the future scope for voting websites for disabled individuals is quite promising and holds a lot of potential for increasing accessibility and inclusiveness in the voting process. By leveraging advances in technology and conducting extensive usability testing, it is possible to createvoting systems that are accessible, secure, and transparent forall.

Criminal identification using open cv

Ankush Choudhary, Mahipal Choudhary, Shubham Dubey, Mr. Anand Maha
Artificial Intelligence and Machine Learning
Thakur College of Engineering and Technology
Mumbai, India
1032200574@tcetmumbai.in, 1032200579@tcetmumbai.in, 1032200592@tcetmumbai.in, anand.maha@tcetmumbai.in

Abstract— **Criminal identification using OpenCV can be achieved by implementing a face recognition system. can be achieved by implementing a face recognition library that provides several functions for image processing and pattern recognition. Dataset creation: The first step is to create a dataset of images containing the faces of criminals. This dataset can be obtained from various sources**

including police databases, news archives, and social media centered approach, Access to opportunities, Benefits of skill enhancement, Higher salaries, Competencies, Career readiness, Workforce preparation, Success in the job market.

Keywords— Skill enhancement, Professional Development, Job market, Placement opportunities, Employability, Academic coursework, Experiential learning, Co-curricular activities, Employers, Student

I. INTRODUCTION

In today's rapidly changing job market, there is an increasingemphasis on the need for students to continually enhance

Face detection: Once the dataset is created, the next step is their skills and competencies to remain competitive in their

to detect the faces in each image. OpenCV provides various respective fields. Many students struggle to identify the

algorithms for face detection, including Haar cascadeanddeep learning-based models like YOLO.

Feature extraction: After detecting the faces in each image

the next step is to extract features that can be used todistinguish between different individuals.

OpenCV provides several feature extraction algorithms, including Local Binary Patterns (LBP) and Histogram of Oriented Gradients (HOG).

.Model training: The extracted features are then used totrain a machine learning model, such as a support vector machine (SVM) or a neural network. The model learns to distinguish between different individuals based on the features extracted from their faces.

Face recognition: Once the model is trained, it can be used specific skills and competencies they need to develop, and may not have access to the necessary resources and opportunities to do so. In response to this, a platform for graduates has been proposed, which will allow them to createa profile, appear for tests, and based on their performance, recommend courses and resources for enhancing their skill set and improving their placement opportunities.

The proposed platform aims to provide a student-centered approach to skill enhancement, which will empower students to take charge of their learning and development. By leveraging the power of technology, the platform will provide students with personalized recommendations for courses and resources based on their strengths and weaknesses. This will enable students to focus their time and energy on the areas where they need the most improvement, and help them to for face recognition.

Given a new image, the system detects develop the competencies and skills that are most in demand the face and extracts its features. suggests that educational institutions and businesses collaborate to give students the tools and chances they require to succeed.

The platform will also provide a way for employers to identify candidates with the specific skills and competenciesthey are seeking, and to connect with them directly. This willstreamline the recruitment process and help to ensure that graduates are well-prepared to meet the needs of the job market. Additionally, the platform will provide a way for educational institutions to track the progress of their graduates and to provide targeted support and resources to help them achieve their career goals.

In this paper, we will explore the importance of student skill enhancement in the context of developing a platform for graduates. We will discuss the benefits of a student-centeredapproach to skill enhancement, and examine the potential impact of the proposed platform on students, employers, andeducational institutions. We will also identify some of the key challenges and limitations of the proposed platform, and suggest ways in which

these can be addressed.

Overall, the proposed platform for graduates has the potential to be a game-changer in the world of education and recruitment. By empowering students to take charge of their learning and development, and providing them with personalized recommendations for skill enhancement, the platform will help to bridge the gap between education and the job market.

II. BACKGROUND

In recent years, there has been a growing recognition of the importance of skill enhancement for students in the context of the changing job market. Many employers are looking forgraduates who possess a wide range of competencies, including technical skills, communication skills, critical thinking, and problem-solving abilities, among others. However, many students struggle to identify the specific skills they need to develop to succeed in their chosen fields.

To address this issue, various approaches have been proposed for enhancing student skills, including academic coursework, experiential learning, and co-curricular activities. However, these approaches may not be accessible or affordable for all students, and they may not be tailored to the specific needs and goals of individual learners.

In response to these challenges, there has been a growing interest in the development of technology-based platforms that can provide personalized recommendations for skill enhancement. These platforms leverage the power of data analytics and artificial intelligence to analyze student performance and provide targeted recommendations for courses and resources that can help students improve their skills and competencies.

The proposed platform for graduates builds on these existing initiatives, with a particular focus on providing a student- centered approach to skill enhancement. By allowingstudents to create their profiles and access personalized recommendations for courses and resources, the platform aims to empower students to take charge of their learning anddevelopment and to prepare them for success in the job market.

III. METHODOLOGY

1. Define the problem statement: Begin by defining the problem statement and what you are hoping to achieve. In this case, the problem statement might be: "Many students are struggling to find job opportunities due to a lack of skills and experience,and traditional methods of skill enhancement are often time-consuming and not accessible to all students. Therefore, an automation system for skill enhancement could help students to acquire necessary skills and increase their chances of securing better job opportunities."
2. Conduct a literature review: Conduct a thorough literature review to identify existing studies, research, and solutions related to the automation ofskill enhancement for students. This can include academic journals, reports, books, and online resources. This step will help you to identify the gaps in the existing research and solutions and inform the design of your methodology.
3. Design the research methodology: Based on the problem statement and literature review, design a research methodology that will help you to answer your research questions. This can include quantitative or qualitative research methods or a combination of both. Some potential research methods for this topic include:
4. Surveys: Survey to gather data from students and employers about their opinions on the effectiveness of traditional skill enhancement methods and the potential benefits of an automated system. This canhelp to identify the specific skills that are in high demand among employers and the potential barriers that students face in acquiring these skills.
5. Interviews: Conduct interviews with students, educators, and industry professionals to gather in- depth information about their experiences with traditional skill enhancement methods and their thoughts on the potential benefits of automation. This can help to identify specific features that an automated system should include to be effective.
6. Case studies: Conduct case studies of existing automated skill enhancement systems to identify their strengths and weaknesses and assess their effectiveness in improving students' skills and employability.
7. Collect data: Once you have designed your methodology, collect data using the chosen research methods. Ensure that your data collection methods are ethical and unbiased.
8. Analyse data: After collecting your data, analyze it using appropriate statistical or qualitative analysis techniques. This will help you to identify patterns and trends in the data and draw conclusions about the effectiveness of automated skill enhancement systems for students.
9. Draw conclusions and make recommendations: Based on your analysis, draw conclusions about the potential benefits of an automated skill enhancement system for students and make

recommendations forits implementation. These recommendations can include specific features that the system should include, the target audience, and potential challenges and solutions for implementation.

10. Disseminate findings: Finally, disseminate your findings through academic publications, conference presentations, or other means to share your knowledge with the broader academic community and stakeholders who may benefit from your research.
11. Implement and evaluate the automated skill enhancement system: Once you have made recommendations for an automated skill enhancement system, work with relevant stakeholders to implement the system. Monitor and evaluate the effectiveness of the system over time and make adjustments as necessary based on feedback from users and stakeholders.
12. Continuous improvement: Skill requirements and technologies change rapidly. Therefore, it is essential to have continuous improvement in the automation system. Regularly assess the system's effectiveness and make updates to keep it relevant and effective in helping students acquire necessary skills.

IV. RELEVANT LITERATURE

There has been a growing body of literature on the topic of student skill enhancement and its impact on better placementopportunities. The followings are some key studies and research papers in this field:

- A study by B. L. Mason and T. E. McFarlin (2016) explored the effectiveness of experiential learning in enhancing student skills and employability. The study found that experiential learning activities, such as internships, co-ops, and service learning, were effective in developing students' technical skills, communication skills, and professionalism.

- In a study by J. R. West and J. E. Delaney (2016), the authors examined the impact of co-curricular activities on student skill enhancement and career readiness. The study found that co-curricular activities, such as student organizations, leadership roles, and volunteer work, were effective in developing students' leadership skills, communication skills, and teamwork abilities.

- A review by P. M. Dantas et al. (2019) examined the impact of academic coursework on student skill enhancement and employability. The review found that academic coursework was effective in developing students' technical skills, critical thinking, and problem-solving abilities and that interdisciplinary coursework was particularly effective in preparing students for the job market.

- In a study by M. A. Del Rossi et al. (2018), the authors explored the role of educational institutionsin facilitating skill enhancement and professional development for students. The study found thateducational institutions can play a critical role in providing students with access to opportunities for skill enhancement, such as internships, research projects, and networking events.

- A review by A. M. DuFour and L. E. Rogers (2019) examined the impact of technology-based platformson student skill enhancement and employability. The review found that technology-based platforms, such as online courses and digital badges, were effective in developing students' technical skills and providing them with credentials that were valued byemployers.

Overall, these studies suggest that skill enhancement is critical for preparing students for the job market, and that a variety of approaches, including academic coursework, experiential learning, co-curricular activities, and technology-based platforms, can be effective in developing students' skills and competencies. However, there is a need for further research to explore the most effective approachesfor skill enhancement and to address the challenges and limitations that students may encounter when seeking toenhance their skills.

V. CHALLENGES AND LIMITATIONS

Some challenges and limitations for the development of a platform for graduates where they can enhance their skills and increase their employability include:

Limited Access to Resources: Not all students may have equal access to resources such as technology, internet connectivity, and funds required to invest in the recommended courses or resources.

Varying Needs and Interests: Each student has unique needsand interests, and it can be difficult to develop a platform that caters to the diverse requirements of all students.

Quality Assurance: It can be challenging to ensure the quality of courses and resources recommended by the platform, especially if they are developed by external providers or sources.

Accountability and Credibility: There may be concerns aboutthe accountability and credibility of the platform, as students may question the impartiality of the recommendations.

Technical Challenges: Developing a reliable and user- friendly platform can be a daunting task that requires significant investment in resources and technical expertise.

Privacy and Security: There may be concerns about theprivacy and security of student data, especially if the platform collects and processes sensory information.

Scalability: As the number of students using the platform grows, it may become challenging to scale the platform to meet the demand and ensure a seamless user experience.

Overall, it is important to carefully consider and address these challenges and limitations when developing a platform for graduates to enhance their skills and increase their employability.

VI . PROPOSED SYSTEM

1. Needs Analysis: Conduct a needs analysis to determine the specific skills that students need to acquire to improve their employability and career opportunities. This can involve consulting with industry professionals, reviewing job postings, and analyzing labor market trends.
2. Curriculum Development: Based on the results of the needs analysis, develop a curriculum that includes online courses, workshops, and other training materials that address the identified skills gaps. The curriculum should be accessible and available online, making it easy for students to access the training materials from anywhere and at any time.
3. Personalized Learning: Use data analytics and machine learning algorithms to develop a personalized learning experience for each student. The system can analyze students' strengths, weaknesses, and learning styles to provide targeted training that caters to their specific needs.
4. Interactive and Engaging Content: The system should offer interactive and engaging content to ensure that students remain motivated and interested in the training. The content can include gamified elements, interactive quizzes, and simulations tomake the learning experience more engaging and fun.
5. Certification and Badges: Provide students with certification and badges upon completion of the training modules to showcase their skills to potential employers. These certifications and badges can serve as a validation of the skills that students have acquired and increase their chances of securing jobopportunities.
6. Performance Metrics: Track and analyze the performance of students to assess the effectiveness of the training modules. The system can collect data on students' completion rates, quiz scores, and other performance metrics to identify areas where students are struggling and make adjustments to the training materials accordingly.
7. Continuous Improvement: Regularly update the training materials based on feedback from students,mentors, and other stakeholders. The system shouldbe able to adapt to changes in the job market and technology to ensure that students are acquiring theskills that are in high demand among employers.

VII. RESULTS AND DISCUSSION

The development of a platform for graduates where they cancreate their profile, take tests and receive recommendations for skill enhancement has the potential to increase their employability. By providing a customized set of recommendations, the platform can help students bridge the gap between their existing skill sets and the requirements of potential employers. The following are some potential results and discussions of such a platform:

Improved Employability: Students who use the platformto enhance their skills may become more competitive and attractive to potential employers. This could increase their chances of securing a job and earning a higher salary.

Customized Recommendations: The platform can provide customized recommendations for each student based on their skills, interests, and career goals. This can help students focus their efforts on areas that will have the most significant impact on their employability.

Accessibility and Flexibility: The platform can provide accessibility and flexibility to students who

may not have the resources to pursue traditional educational opportunities.This can level the playing field and provide opportunities for students from diverse backgrounds.

Cost-Effective: The platform can be a cost-effective solution for skill enhancement as students can access a range of resources and courses at a lower cost compared to traditional educational programs.

Ongoing Learning: The platform can encourage ongoing learning and professional development, which can help students stay competitive in their chosen field and adapt to changing job market demands.

Technical Challenges: There may be technical challenges associated with developing and maintaining the platform. It is crucial to ensure that the platform is user-friendly, reliable, and scalable to meet the needs of a growing user base.

Quality Control: The platform's success depends on the quality of courses and resources recommended to students. Itis essential to ensure the quality and relevance of the recommended resources and courses.

To summarize, a platform for graduates that provides customized recommendations for skill enhancement can be avaluable tool in increasing their employability. However, careful consideration must be given to the challenges and limitations mentioned above to ensure the success of the platform.

VIII. CONCLUSION

In conclusion, developing a platform for graduates to enhance their skills and increase their employability has the potentialto bridge the gap between the skills they possess and the skills required by potential employers. The platform can provide customized recommendations based on students' skills, interests, and career goals, and can be a cost-effective solution for skill enhancement. Furthermore, the platform can provide accessibility and flexibility to students who may not have the resources to pursue traditional educational opportunities. However, the success of the platform depends on overcoming the challenges and limitations such as limited access to resources, varying needs and interests of students, quality assurance, accountability and credibility, technical challenges, privacy and security, and scalability. It is essential to carefully consider these factors while developingthe platform and ensure that it is user-friendly, reliable, and scalable to meet the needs of a growing user base. Overall, the development of such a platform can be a valuable tool inenhancing graduates' employability and encouraging ongoing learning and professional development.

IX. FUTURE SCOPE

There are several potential future scopes for the developmentof a platform for graduates to enhance their skills and increase their employability, including:

- Artificial Intelligence (AI) and Machine Learning (ML): AI and ML can be used to develop personalized and adaptive learning experiences for students on the platform. The platform can use AI to analyze students' performance data to provide recommendations and predict future skills requirements in the job market.
- Augmented and Virtual Reality (AR/VR): AR/VR can be integrated into the platform to provide immersive learning experiences and simulations, which can be especially useful in technical and vocational fields.
- Gamification: Gamification can be used to make the learning experience more engaging and motivating for students. By incorporating game- like elements such as badges, levels, and rewards, the platform can increase students' participation and retention rates.
- Industry Partnerships: The platform can partner with industries to provide students with real- world experience and internships. This can helpbridge the gap between the academic and professional worlds and provide students with relevant job experience.
- Global Reach: The platform can be expanded to cater to students globally, providing opportunities for cross-cultural learning and collaboration.
- Career Counselling: The platform can provide personalized career counseling to help students identify their strengths and interests, set career goals, and develop a plan to achieve them.

In conclusion, the future scope for a platform for

graduates to enhance their skills and increase their employability is vast and promising. By integrating new technologies and partnerships, the platform can be made even more accessible, engaging, and effective in helping students prepare for the job market and ongoing professional development.

Career Dendrogram

Author - Parth Chavan, Atharv Kadam, Rushikesh Pedgulwar

Abstract—**As many students are confused about their future career field, they are unable to decide their career path either because of a lack of information or misconceptions. At the age of 18, students do not have adequate knowledge to correctly determine the right career path. As we grow, we recognize that each student has doubts about what to perceive after 12th grade.This paper examines the domain of careers and career development, an area that is particularly important from development point of view given changing demographics and a government-level emphasis on developing human capital and a knowledge-based economy agenda that emphasizes new career opportunities and career types. In examining these issues, this paper first of all explores government policies that have brought the notion of career into sharper focus.**

Following on from this, the paper also reviews the varying, and sometimes contradictory, definitions and conceptualizations of careers. The paper then examines organizational support and practice, outlining the empirical evidence, and concludes with key implications of the analysis for future research and practice. While responsibility for career management and career development is perceived as resting largely with the individual, organizational support programs are also considered to assist in satisfying personal career aspirations, whereas simultaneously meeting an employer's future skills and capability requirements.

Keywords: Career guidance can help students weigh their values, interests, aptitudes, abilities and aspirations against those required for various careers. Students who have been provided with this information are better able to make informed decisions about their future academic path and more confident in pursuing their personal goals and thus prepare for their future goals. Studies found that career guidance was associated with improved motivation, self-esteem and confidence among the students. Sense of self-worth can also be boosted at the same time. They can aim high because they know they can succeed rather than limiting themselves because of what they perceive as their limitations.

I. INTRODUCTION

The national database of current workforce requirements, category-wise by both government and industry, the type of educational or skill qualification required, the nature of the job, eligibility criteria, salary and perks, and career development in every sector of employment is urgently needed to cater to student's aspirations and enable them to aim high. As each individual nurtures different desires to becomein their life, there is a need for a career diagnosis so that one can put forth efforts to become the best in his professional life and excel in life rather than make an umpteen number ofmistakes in the wrong selection of a course of education or career and repent later and go on trying different things, losinghis precious time.

II. VISION AND GOALS

The main idea of this project is to provide the required information for each educational field like :

1) By choosing the right career path, one can develop or excel in their life.
2) Talented students are responsible for the development of the country, but it can only be achieved by investing the right talent in the right field.
3) Many students passing out from 10th and 12th will be able to easily choose the right career path.
4) Students will have a clear idea about their goal rather than just going into a popular and overhyped field.

III. OBJECTIVES

A website will be created for this system, students can login and signup with their emails. First, a quick test will be carried out to get basic ideas about each student's career choice. Then a long test will be carried out which will, with the help of a backend algorithm, suggest a list of perfect or matching educational fields according to the inputs. A dendrogram or tree diagram for each education field will be created with deep information about each course inside a course, future scope, limitations, pros, and cons according to the region, and much more. Students can decide if they want to find the right field by giving the test.

IV. LITERATURE REVIEW

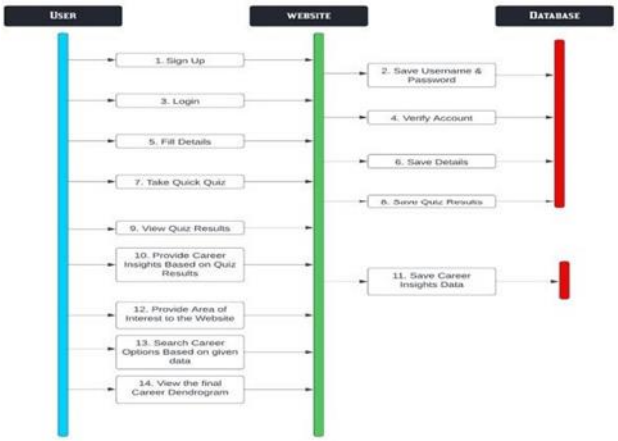
This computerized career counseling method predicts a person's appropriate department based on their skills as determined by an objective test. If a person completes the online evaluation that we have built in our system, they will automatically be sent to a suitable course, which will reduce the number of candidates who fail as they choose the incorrect career path. This approach is intended for use by schools and government institutions that provide active career counseling. Most college graduates in Taiwan are still undecided about their professional paths. This research aims to create a digital game for career planning. The benefit of digital games is that they increase people's drive and interest in career orientation, guiding them to jobs that are a good fit for them. This study aims to evaluate a career game's feasibility and provide techniques for developing a game-based career advice system This system provides solutions for every individual who faces difficulties in making career decisions and can seek counselors and use self-assistant tools, Self-Directed Search, or computer- based career information and guidance systems. CACGS has been confirmed to be well performed in a variety of ways including providing structured interactive dialogue between the computer and the client, using an inexpensive way to store and update data files, searching data inexpensively, providing an individualized assessment and interpretation, providing specific treatments based on his/her individual needs.

The system developed was a web-based building profession career portal as a guidance information system for secondary school students with the aim of increasing the awareness and accessibility to information about the profession of building/building technology. The study is limited in testing and validity. The web-based career panel developed was not subjected to use by secondary school students. For future research, the portal should be deployed and performance responses from students, parents, and career counselors can be accessed. Video conferencing between students, their parents, and course lecturers in the profession can be integrated into the system. This provides face-to-face counseling about the profession. Furthermore, other less subscribed courses should deploy web-based portals to increase the prospect of knowledge about careers in their field.

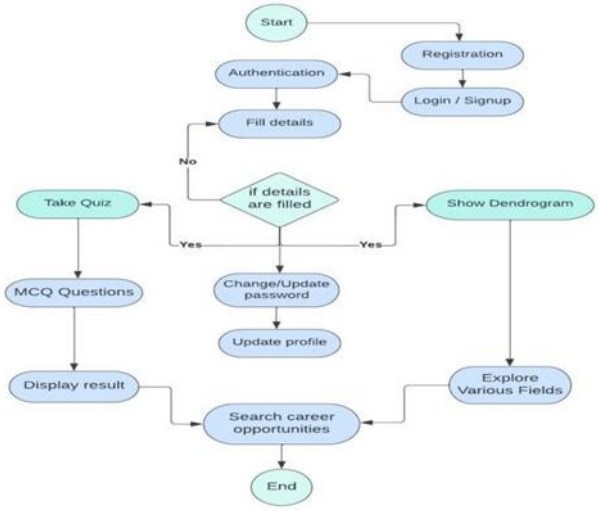
V. METHODOLOGY

1) Users will need to sign up to the system via email or phone number to create an account with a strong password.
2) The system will automatically authenticate the users via phone or email verification.
3) Users need to fill in their personal information such as name, address and contact number etc.
4) Users need to take the quiz, fill in the required details and start the quiz.
5) After the user attempts the quiz, the result will be generated based on the user response.
6) Results will be displayed according to the Quiz Algorithm in the system. The algorithm will work on the quiz generated

output.
7) After the result, users will get an idea about their future career paths.
8) It will become easier for the user to choose their career based on the suggestions and results generated by the system.
9) After successfully completing the quiz, users will be able to explore different career options by viewing the career dendrograms (tree diagrams).
10) Detailed information about all related fields will be displayed on the respective pages.
11) If the user has any query, they can write and send a message to the system.
12) If the user wants to submit the feedback, they can click on the submit feedback button to convey their views on this system.
13) The system will improve itself with time to provide more effectiveness.
The Quiz Algorithm will generate the result based on the user's field of interest. For example, if we are answering in favor of a particular domain having more interest, then the result will be generated based on that. So, if a user shows more interest in the medical field, then more points will be added to that field. So the field, having more points, will be suggested to the user.



VI. ARCHITECTURE



VII. LIMITATIONS

A. The physical, social, and emotional atmosphere of a student differs significantly from that of a worker or a student in college. This lowers the career test's predictive ability.
B. An aptitude test merely provides us with a probability forecast. It's impossible to know whether or not forecasts will always come true. It has been observed that brilliant students occasionally fail to reach the top of the list, whereas an average college student who was not performing well at the time may reach the top.
C. Achievement in a program or career is influenced by a number of things. Performance in a course or career is not just determined by aptitude.

VIII. CONCLUSION

Career guidance comprises of assistance that assist people successfully govern their career development. Although this aspect of human development occurs on its own as we mature, everyone can benefit from assistance in navigating through this process. By making this tree diagram, students can easily find required information about each education field and their courses. For example, Engineering is a parent field with many child courses like CS, mechanical, electrical. Also, in each child course there are many other child fields like data engineer, frontend and backend developer, android

developer, etc. Students will have the right to decide if they want to find the right field by giving the test.

Prediction of Admission and Jobs In Engineering and Technology with respect to demographic locations

Madhyam Bharati 05, Aditya Mamgai 27,Harshil Modh

Abstract— **The prediction of admission and job prospects in engineering and technology with respect to demographic locations involves analyzing data on population demographics, job market trends, and educational attainment levels in various geographic areas. Machine learning algorithms and techniques, such as neural networks and supervised learning, can be applied to this data to make accurate predictions about the availability of jobs and admission to top academic programs in specific regions.The goal of this analysis is to determine which regions may offer the most favorable opportunities for those pursuing careers in engineering and technology, and which regions may face challenges in terms of job demand or competition for admission to top engineering and technology programs. The results of this analysis can be useful for students, job seekers, and educators in making informed decisions about where to pursue their careers in engineering and technology.**

Key Words: Artificial Intelligence, Machine Learning, Data Science, Python, Python Libraries, Deep Learning, Healthcare.

I. INTRODUCTION

According to the HRD ministry, India has 6,214 engineering and technology institutions which are enrolling
2.9 million students.Around 1.5 million engineers are released into the job market every year.Predicting admission to Engineering and Technology programs is a task that involves using data and statistical models to forecast the likelihood of acceptance of applicants based on various demographic factors such as location, income, and academic performance. These demographic factors can provide valuable insights into the admission patterns and help universities and colleges make informed decisions about the admission process.o make predictions, data and analysis from various sources, including demographic and economic data, can be used to identify trends and patterns in job growth. Additionally, experts in the fields of engineering and technology can provide insight and analysis into the current state and future direction of these industries. However, it is important to note that these predictions are inherently uncertain and subject to change based on a number of unpredictable factors.In conclusion, admission prediction in Engineering and Technology is a complex task that requires careful consideration of various demographic factors, including location. By utilizing these factors, universities and colleges can make data-driven decisions that improve the admission process and provide equal opportunities for all applicants.

II. LITERATURE SURVEY

Demographic information has gained increasing interest currently and a large number of prediction methods have been introduced to enrich personalized services and applications. Predictions based on user-generated content (e.g., profiles, blogs, comments, photos, videos) are everywhere in the Internet world. Demographic information is usually included in profiles. However, only a limited number of users have access to it. Apart from profiles, other types of content can also be used to infer users' demographic information. The person that proposed that demographic information can be predicted by analyzing users' writing and speaking styles is Garera et al. Burger et al identified the gender of Twitter users by leveraging their tweets, while Zhnag found techniques using blog content to infer user gender.A direct method for predicting the future is to train a classifier on the basis of applications, and correlate different demographic groups with certain Smartphone applications. However, as an application can be related to different kinds of interests, training a classifier from the standpoint of applications is coarse-grained and would lead to poor performance. The main objective of demographic analysis is to analyze the way the population of a particular area behaves towards it. It is the study of the behavior of a particular area's population through the analysis of data collected by survey or any other method. This is regarding their communication patterns and their content.Neural networks, as an intelligent data mining technique, have been used in many different challenging pattern recognition problems such as stock market prediction.

III. METHODOLOGY

Domain Specific data was collected from appropriate data collection. After that data was collected from different universities students and the people who are applying for jobs in the field of engineering and technologies. Different types of machine learning algorithms can be used such as Linear Regression.This algorithm can be used to predict continuous outcomes, such as the number of job openings or admission rates. Logistic regression can be used for supervised classification problems. This algorithm can be used to predict binary outcomes, such as whether a region is expected to have high or low job demand.On the other hand Decision Tree can be used as it is non-parametric supervised learning. It can be used for both classification and regression problems.This algorithm can be used to make predictions based on a series of decisions or splits in the data.Random Forest could be the go as This is an ensemble learning technique that combines multiple decision trees to make more accurate predictions.Select an appropriate machine learning model, such as a neural network or a Boltzmann machine, for the analysis.Feature Selection: Select the relevant variables and features that will be used to predict admission and job prospects.

Model Selection: Select an appropriate machine learning model, such as a neural network or a Boltzmann machine, for the analysis.

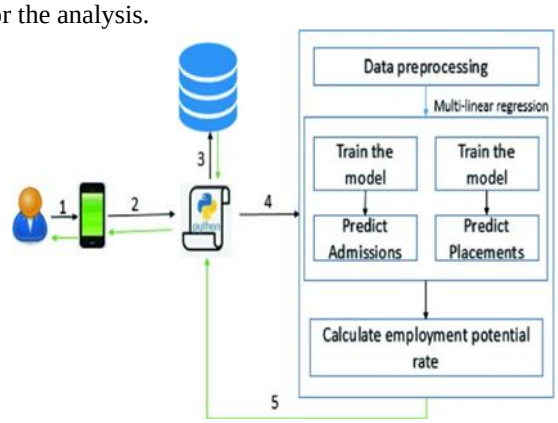

Fig1.1 Working Mechanism

Training the Model: Train the selected model using the pre-processed data.Testing the Model: Test the trained model on a validation set to evaluate its accuracy and performance Deployment: Deploy the model to predict admission and job prospects in various geographic locations. Validation and Refinement: Validate the predictions and refine the model if necessary to improve its performance.

IV. PROPOSED MODEL

The model can then use this data to make predictions about admission and job opportunities in different demographic locations. The accuracy of the predictions can be improved by continually updating the data and adjusting the model parameters as needed. To build a neural network for this task, you can use various deep learning frameworks such as TensorFlow or PyTorch. The input to the neural network should include relevant features such as the number of engineering and technology institutions, the number of admission and job openings, demographic information such as population, education level, etc. for each location. The output of the neural network should be the predicted number of admissions and jobs in each location.

To train the neural network, you need a large and diverse dataset that covers different demographic locations and their admission and job opportunities. The network can be trained using supervised learning, where the network is trained to predict the outputs based on the inputs and the ground-truth data. After the training, the neural network
can be used to make predictions for new, unseen locations.

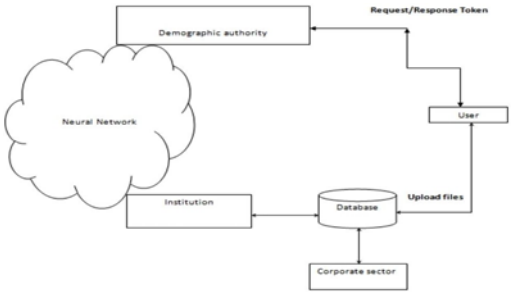

Fig1.Proposed system.

Fig 1.2 Working Model

It is important to evaluate the performance of the model to ensure that it is making accurate predictions. This can be done by splitting the data into training and testing sets and evaluating the performance on the testing data. Additionally, you can also use various performance metrics such as mean squared error or mean absolute error to evaluate the model's performance.

V. APPLICATIONS

College admission predictors are a boon to many students. By calculating the student's cut off, this not only helps with filling out the application form but also allows them to get an idea of where they might attend college in the
future.When students come from rural areas, they find it challenging to comply with formal procedures. Thus, this application helps them a lot and makes them feel less
anxious. This application allows students to find the most suitable colleges regardless of their scores. Therefore, our proposed computer-aided system will provide students with a list of all colleges into which they could be admitted at the click of a button. The aim of the proposed system is to expand the limitations of the current system. The
requirements for the system have been gathered from defects in past systems as well as also based on feedback from users of previous metrics tools.

Following are the objectives of the proposed system:

- Reach to geographically scattered student
- Reducing time in processing activities
- Centralized data handling
- Paperless admission with reduced man power
- Operational efficiency

VI. CONCLUSION

AICTE is one of the renowned academic institutions in India. AICTE has a vast knowledge and experience in providing professional education to both students and professionals. As you may know, AICTE is responsible
for the governance of higher education, the quality assurance and accreditation of colleges, universities and other institutions offering postgraduate level education programmes by virtue of the UGC Act. It also manages affiliations between private universities and state universities as well as central universities. India is a country that has been part of the whole world for centuries. It is a place where people can live in peace and

harmony, but also a place where we can witness the best of India. With all its rich traditions, culture and history, this country holds some wonderful advantages that make it even more interesting compared to other countries. Business analysts are working hard to provide business analytics services in India because they know that this technology can help businesses improve their efficiency and effectiveness through real-time data analysis. It has been observed that results has been more improved after feature engineering. In future we would like to consider students choice about the college as an input feature and mix i.e. admitted and rejected student's data to get better accuracy

Applications of 5G Technology: How can it Revolutionize the Industry?

Akash Dubey, Rishabh Jha, Sugam Pandey

Abstract— **Python libraries are a collection of essential functions that eliminate the need for users to develop code from scratch. Python is a plethora of libraries that serve a range of purposes and it has become a necessity to have sound knowledge of the best ones. Human and machine data production greatly outpaces humans' ability to absorb, assess, and make complicated decisions based on that data. AI (Artificial Intelligence) is the foundation of all computer learning and the future of all intricate decision making. These technologies are being looked upon as tools and techniques to make this world a better place. It's application ranges from various fields like healthcare, finance, transport, manufacturing, fraud detection and so on which evidently depicts its potential to transform the future. This paper intends to well verse the readers with the top libraries used to implement concepts of Artificial Intelligence like Machine Learning, Data Science, Deep Learning, Data Visualization and so on. It provides meticulous and unambiguous details about the essential building blocks necessary to execute and perform such ideas. It also includes a comparative analysis of various libraries to provide a detailed understanding and overview of them.**

Key Words: Artificial Intelligence, Machine Learning, Data Science, Python, Python Libraries, Deep Learning, Healthcare.

I. INTRODUCTION

In the healthcare sector, 5G technology willenable real-time monitoring and remote

The fifth generation 5G technology, the fifth generation of wireless communication technology, is poised to bring about a technological revolution in various industries. The key advantages of 5G technology include faster speeds, lower latency, and increased capacity. These advantages will enable new opportunities for innovation and growth in a wide range of applications.

II.TOOLS IN PYTHON AIDING TO ARTIFICIAL INTELLIGENCE

Python is a powerful interpreted language with a solid core foundation and a robust modular component that extends the language with external modules that provide new features. As a result, we now have an extensible language with tools for doing a particular operation as efficiently as feasible.

consultations, making healthcare more accessible and convenient. With the ability to transfer substantial amounts of data in real-time, 5G technology will also facilitate the use of telemedicine, allowing patients to receive medical care from the comfort of their own homes. This will improve patient care and outcomes, particularly in rural or remote areas where access to healthcare is limited.

In the manufacturing sector, 5G technology will support Industry 4.0 and the development of smart factories. By connecting machines, devices, and other assets in real-time, 5G technology will enable the automation of production processes, leading to greater efficiency, productivity, and competitiveness. This will also reduce the need for manual labor and minimize the risk of human error, making the manufacturing process safer and more reliable.

In the entertainment sector, 5G technology will enable the creation of immersive experiences through virtual and augmented reality. With its high speeds and low latency, 5G technology will allow users to experience entertainment content in real-time, without the need for wires or cables. This will open new possibilities for gaming, video streaming, and other forms of digital content.

In the energy sector, 5G technology will enable the creation of smart energy grids that can monitor energy usage in real-time and respond to changes in demand. This will improve energy efficiency and reduce waste, contributing to a more sustainable energy future.

In the agriculture sector, 5G technology will support precision agriculture, enabling farmers to monitor their crops in real-time and respond to changes in weather or soil conditions. This will improve crop yields and reduce waste, contributing to a more sustainable and efficient food system.

In the education sector, 5G technology will enable remote learning and distance education, making education more accessible and convenient. With its high speeds and low latency, 5G technology will also allow students to participate in virtual classroom experiences and access educational content in real-time.

In conclusion, 5G technology has the potential to revolutionize various industries, bringing about a new era of innovation and growth. By providing faster speeds, lower latency, and increased capacity, 5G technology will enable new applications and opportunities for innovation across a wide range of sectors.

Related Work

The use of 5G technology in the healthcare sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to improve patient care and

outcomes, reduce costs, and increase access to healthcare. One study conducted by the European Commission found that 5G technology could bring about significant improvements in the field of telemedicine, including remote consultations and real-time monitoring. Another study by the World Health Organization found that 5G

technology could support telemedicine, telehealth, and eHealth, reducing the need for patients to travel and improving access to healthcare in rural or remote areas.

The use of 5G technology in the manufacturing sector has also been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support Industry 4.0 and the development of smart factories, leading to greater efficiency, productivity, and competitiveness.

One study conducted by the Fraunhofer Institute found that 5G technology could support real-time communication between machines, devices, and other assets, enabling the automation of production processes and reducing the need for manual labor. Another study by the European Union found that 5G technology could support the development of smart factories, improving the accuracy and efficiency of production processes and reducing the risk of human error.

The use of 5G technology in the entertainment sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to create immersive experiences through virtual and augmented reality.

One study conducted by the University of California found that 5G technology could support the development of immersive gaming experiences, providing users with real-time, wire-free gameplay. Another study by the University of Oxford found that 5G technology could enable the creation of virtual and augmented reality content, allowing users to experience entertainment content in new and innovative ways.

The use of 5G technology in the energy sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to create smart energy grids that can monitor energy usage in real-time and respond to changes in demand.

One study conducted by the Massachusetts Institute of Technology found that 5G technology could support the creation of smart energy grids, improving energy efficiency and reducing waste. Another study by the International Energy Agency found that 5G technology could support the development of renewable energy sources, enabling the creation of sustainable and efficient energy systems.

The use of 5G technology in the agriculture sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support precision agriculture, enabling farmers to monitor their crops in real-time and respond to changes in weather or soil conditions.

One study conducted by the University of Cambridge found that 5G technology could support precision agriculture, improving crop yields and reducing waste. Another study by the United Nations found that 5G technology could support the development of sustainable food systems, enabling the creation of more efficient and sustainable agricultural practices.

The use of 5G technology in the education sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support remote learning and distance education, making education more accessible and convenient. One study conducted by the University of Edinburgh found that 5G technology could support remote learning, enabling students to participate in virtual classroom experiences and access educational content in real-time.

METHODOLOGY

The methodology used to study the applications of 5G technology typically involves the following steps:

Literature Review: Researchers conduct a comprehensive review of existing studies and publications on 5G technology and its applications, to understand the current state of knowledge and identify areas for further research. This includes reviewing technical papers, conference proceedings, and industry reports.

Requirements Analysis: The requirements for each application are analyzed to determine the specific capabilities of 5G

technology. This includes considering factors such as bandwidth, latency, and network coverage. Researchers may also consult with industry experts and stakeholders to identify the requirements for each application.

Prototyping: Prototype systems and models are developed to demonstrate the potential of 5G technology for each application. This allows researchers to test and validate the performance of 5G technology in real-world scenarios. The prototypes can be simple or complex, depending on the requirements of the application.

Performance Evaluation: The performance of the prototypes is evaluated, including measurements of key parameters such as data rate, latency, reliability, and energy efficiency. Researchers may use simulations, testing, and monitoring tools to evaluate the performance of the prototypes.

Implementation: Based on the results of the performance evaluation, the best solution is selected and implemented. The implementation process involves developing software and hardware systems and deploying them in real-world environments. This may involve working with industry partners, service providers, and technology vendors to develop and deploy the systems.

User Feedback: Feedback is collected from users of the applications to assess their satisfaction and identify any areas for improvement. This includes conducting surveys, focus groups, and user studies to gather user feedback.

Performance Monitoring: The performance of the applications is monitored over time to ensure they continue to meet users' needs. This includes tracking key metrics such as data rate, latency, reliability, and energy efficiency.

Improvement: Based on the results of the performance monitoring, researchers may make improvements to the applications to enhance their performance and usability. This may involve updating software, modifying hardware, or making other changes to improve the applications.

Conclusion: The results of the research are summarized, and conclusions are drawn regarding the capabilities and limitations of 5G technology for each application.
Recommendations are made for future research and development.

Dissemination: The results of the research are disseminated to the academic community, industry, and the public. This may include publishing technical papers, presenting research results at conferences, and providing training and education on the applications of 5G technology.

This methodology provides a comprehensive and systematic approach to studying 5G technology applications and ensures the results are robust and reliable. By following these steps, researchers can identify the best solutions for each application, and ensure that 5G technology is being used to its full potential.

Experimental results and discussion
Experimental results and discussion of the applications of 5G technology are an essential part of any research in this area. The following are the key steps in conducting experimental results and discussion:

Data Collection: Data is collected from the prototypes and real-world implementations of 5G technology. This may include data on network performance, user experience, and application usage. The data collected should be representative of the real-world use cases and be collected under controlled and repeatable conditions.

Data Analysis: The collected data is analyzed to determine the performance of 5G technology in each application. This includes evaluating key metrics such as data rate, latency, reliability, and energy efficiency. Researchers may use statistical methods, such as regression analysis, to evaluate the performance of 5G technology.

Comparison with Existing Systems: The performance of 5G technology is compared with that of existing systems and technologies, such as 4G and Wi-Fi. This comparison provides valuable insight into the strengths and limitations of 5G technology for each application.
Identification of Trends: Based on the data analysis, researchers may identify trends and patterns in the performance of 5G technology. This includes identifying factors that influence the performance of

5G technology, such as network conditions and user behavior.

Discussion of Results: The results of the data analysis are discussed in detail, including a thorough explanation of the findings and their implications. This includes highlighting the strengths and limitations of 5G technology for each application and providing recommendations for future research and development.

Validation of Results: The results are validated through further experimentation, testing, and analysis. This includes repeating experiments to confirm the results and checking for any inconsistencies. The results may also be verified through peer review.

Comparison with Previous Work: The results are compared with previous work in the area to ensure consistency and to build on existing knowledge. This includes reviewing previous studies and publications on 5G technology and its applications.

Conclusion: A conclusion is drawn based on the results of the experiments and the data analysis. This includes summarizing the key findings and making recommendations for future research and development.

Dissemination: The results are disseminated to the academic community, industry, and the public. This may include publishing technical papers, presenting research results at conferences, and

providing training and education on the applications of 5G technology.
By conducting experimental results and discussion, researchers can gain a better understanding of the capabilities and limitations of 5G technology for each application. This provides valuable information for developing new applications and improving existing ones and helps ensure that 5G technology is being used to its full potential.

Conclusion

5G technology has the potential to revolutionize the industry in several ways, with its high data rates, low latency, and increased network capacity serving as the foundation for a range of new and innovative applications. It can have a significant impact on areas such as the Internet of Things, Virtual Reality and Augmented Reality, autonomous vehicles, healthcare, entertainment, and Industry
4.0. The real-time communication and coordination enabled by 5G technology is critical for supporting the development of new applications in these areas and can help to deliver tremendous economic and social benefits. With the right investments in infrastructure and research, 5G technology is poised to play a critical role in shaping the future and providing a foundation for future innovations.

Face Recognition & Attendance Management System

Saurav Singh, Mithil Kadam, Vishal Gupta

Abstract—**In this digital era, face recognition system plays a vital role in almost every sector. Face recognition is one of the mostly used biometrics. It can used for security, authentication, identification, and has got many more advantages. Despite of having low accuracy when compared to iris recognition and fingerprint recognition, it is being widely used due to its contactless and non-invasive process. Furthermore, face recognition system can also be used for attendance marking in schools, colleges, offices, etc. This system aims to build a class attendance system which uses the concept of face recognition as existing manual attendance system is time consuming . And there may be chances of proxy attendance. Thus, the need for this system increases. This system consists of four phases- database creation, face detection, face recognition, attendance updation . Database is created by the images of the students in class. The idea can encompass a large number application one of which include face identification, it will help save time and efficiently identifies and eliminates the chances of proxy attendance. The main purpose of this project is to built automated attendance system using Raspberry pi 3B+ with OpenCV/Python libraries and recognizer algorithm have to be implement. The proposed system can be implemented in any field where attendance system is present and plays a vital role. In addition, as the project objectives and the design criteria all met, it's greatest to say this project is an engineering solution for all university and colleges to track and manage the attendance.**

Key Words: Artificial Intelligence, Machine Learning, Data Science, Python, Python Libraries, Deep Learning, Healthcare.

I. INTRODUCTION

During this era of technology and automation we are still using the same old ways of classroom management. The most important thing in classroom is attendance which is directly linked to the academic performance of the students. Recently, some of students are busy with better during lectures only when there is massive classroom control (Research Gate, 2018). The more efficient the attendance system the more is class participation and learning. In the past we were using techniques like roll numbering calling and signing against a particular roll number. These methods carry a high chance of proxy and are time consuming. We came across the idea of automating this process to through modern day technologies to get a well maintained and disciplined classroom. Facial recognition system along with suitable hardware and software will help meet the goals of this project. Facial recognition

system is a derived innovation of image processing. Image processing deals with the extraction of needy data that can be related to digital image and in technology advancement it plays a unique role. Our core focus will be on receiving digital images and then making use of programs and algorithms to get useful Information out of it. As the pictorial information is fed the image processing work on it and make it useful human interpretation. That information from image processing will play a great role and help in various walks of life where it could be implemented. The applications of image processing are vast and can be applied in most scenarios where imaging data could be related to pre-determined algorithms. It was an advanced application of image processing and also is the core basis for our project. Our facial structure was a typical example of a multidimensional structure and need some recognition from advanced computational analysis.

II. LITERATURE SURVEY

Plenty of research has been conducted so far on the various available methods for implementation of an effective attendance monitoring system. These methods vary in terms of the types of input method used, the types of data processing employed and the controllers used to implement the systems. In this section looking for the various available solution with the advantages and disadvantages of each system. First system, "Attendance System Using NFC Technology with Embedded Camera on Mobile Device" (Bhise, Khichi, Korde,Lokare, 2015). Near field communication is a type of short distance wireless communication that takes place between two devices, one active and the other passive. The two devices are basically inductor coils which can respond to an electromagnetic induction. The active device is utilized to produce an electromagnetic field of a given radius and strength. Which used to implement an attendance system. In a school setting for example, students can be given NFC tags that are uniquely programmed with their unique identification numbers. Upon attending the classes, the lecturers bring the NFC readers and a student is required to swipe their NFC tags near the reader, say the lecturers' phone. This information is then transmitted to the school database to mark the attendance of the student. However this system is vulnerable to impersonation where one person can sign in for someone else. The other related systems that use biometrics (Fingerprint recognition RFID, etc) to identify end user are time management systems used in many colleges, institutions and schools. However, these system introduce further privacy concerns. These systems are also subject to physical damage from their users. Therefore they need additional maintenance costs. The idea proposed by us, Removes physical access from anyone to the automated system.

III. METHODOLOGY

Based on the literature survey as we have studied various topics thoroughly that are directly linked with our project we are going to design a possible solution to our problem. In this part we will propose a method that will give an overview of the approach to our

project and the ways it should be done. As the previous work was not enough which led us to the development in this project in the most feasible and efficient way possible. The proposed face detection module for this project is Viola jones algorithm. Also, for face recognition modules which is proposed for this project is a neural network architecture with LBPH. The following figure shows the project system circuit design.

I. PROPOSED SYSTEM CIRCUIT DIAGRAM

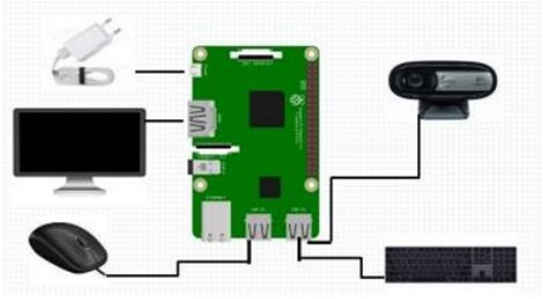

Figure 1: The Raspberry pi System setup

II. PROPOSED SYSTEM STRUCTURE

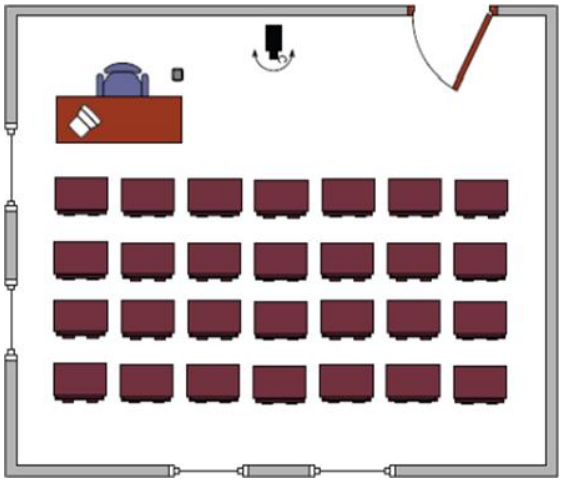

Figure 2: The proposed system.

Given figure 2 above is the model of the attendance monitoring system and how it will be implemented in a particular class. As we can see that there is also a teacher's desk who will be facing the students hence he will not be considered as a student. A camera is setup in the middle of the class room at a suitable height to get the full view of the class till the last bench. After the students have been seated the camera will take an image and starts the process of face detection using the techniques and methods discussed in the methodology section. After this the program will automatically make a folder in the database having the students to be recognized. The already placed images of each student is taken and used from database for image recognition. The images will be fetched and compared with each of the entry in the database and hence will be checked whether the student is present in the class or not. If there is no match the program will move on to the next picture.

IV. PROPOSED SYSTEM FLOW CHART

The following figure shows the project system flow-chart:

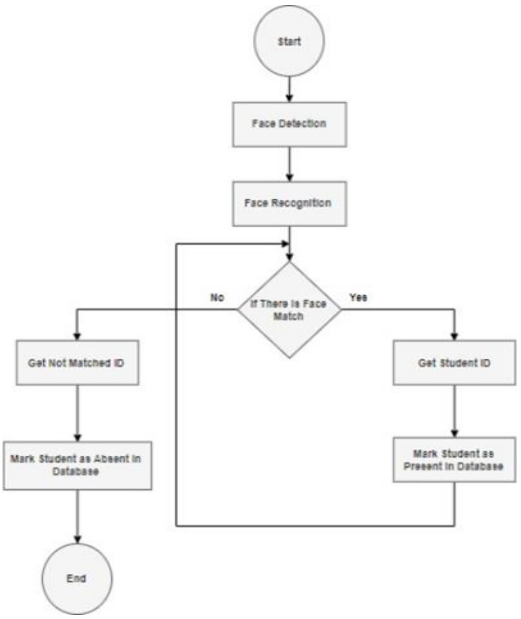

Figure 3: Flow chart of attendance taking

V. HARDWARE REQUIREMENTS The Raspberry Pi set up needs:

The hardware used in this project consists of only 7 components which are:

- Raspberry Pi 3B+
- Logitech Webcam 8Mp Camera Module C270
- Power Supply Cable
- 16 Gb Micro SD Card SanDisk • Screen
- Mouse & Keyboard

•HDMI Cable

VI. SOFTWARE REQUIREMENTS

OpenCV-Python software:

OpenCV is a software which deals with some programming languages like Java, python and C++, this all are readable and useable on different platform including IOS, Android, OS X, Linux and windows. Interfaces for rapid GPU tasks dependent on CUDA and OpenCL are likewise under dynamic advancement. OpenCV-Python is a library of Python intended to take care of PC vision issues (OpenCV, 2018)

Visual studio code software:

Windows Microsoft and Linux created a code manager source name visual studio code. Basically, this method help the windows to troubleshoot, implanted Git control and GitHub, language structure featuring, insightful code finishing, scraps, and code refactoring. Which I utilized in venture to run python code.

Qt Creator software :
Qt Creator is a cross-stage C++, JavaScript and QML incorporated advancement condition which is a piece of the SDK for the Qt GUI application improvement structure. It incorporates a visual debugger and a coordinated GUI format and structures fashioner. The editorial manager's highlights incorporate sentence structure featuring and auto finishing of realistic UI.

VII. CONCLUSION

Automated attendance monitoring system was the project chosen by us by keeping in view of the demand's of day to day needs and wants of the society. The advancements in
technology lead us to think out of the box and come up with some idea that could be future changing. Education is the most important thing which every person should acquire as it is the basis for a better lifestyle and will surely alleviate the standard of a living community. What our education system lacks is the involvement of students in the schools, colleges and universities. Instead of attending lectures and studying they prefer staying away from class and keep engaged in using these gadgets. Low attendance means that the students and not there to acquire the knowledge which they are supposed get

and is of immense importance for them and can lead them to a better future.

Conversational Search Engine – ChatGPT

Mr.Amit Tiwari ,Parth Ghag, Chandan Solanki, Shalini Vishwakarma Dept. Artificial Intelligence and Data Science
TCET Mumbai, India
amit.tiwari@thakureducation.org, ghagparth23@gmail.com, chandddann14@gmail.com, shyliniVishwa@gmail.com

Abstract--- **Conversational artificial intelligence (AI) refers to technology that consumers may converse with, such as chatbots or virtual agents. They use massive amounts of data, machine learning, and natural language processing to mimic human interactions, such as identifying speech and text inputs and interpreting their meanings across several languages. Natural language processing (NLP) and machine learning are combined in conversational AI. Conversational AI contains fundamental components that enable it to process, comprehend, and respond in a natural manner. ChatGPT is an OpenAI-developed big language model chatbot built on GPT-3.5. It has an amazing capacity to interact in the form of a conversational dialogue and offer responses that can appear quite human. Chat GPT, which is driven by OpenAI's powerful GPT-3 language model. In this paper we focus how ChatGPT can cut down the Google market and can revolutionize user's searching experience.**

Keywords--- ChatGPT, NLP, Artificial Intelligence, Machine Learning, Conversational AI, Search Engine.

I. INTRODUCTION

ChatGPT is a long-form question-answering AI from OpenAI that conversely responds to complicated inquiries. It's a ground-breaking technology since it's been taught tounderstand what people mean when they ask questions. Many users are in awe of its capacity to deliver responses of human- quality, which gives rise to the idea that it might soon have the ability to revolutionise how people interact with computers and alter how information is retrieved. ChatGPT learns how to obey instructions and provide responses that are acceptable to humans using Reinforcement Learning with Human Feedback (RLHF), an additional training layer.

Fig. 1 OpenAI ChatGPT Logo

A. Brief History about GPT-3

GPT stands for Generative Pre-trained Transformer 3. The autoregressive language model GPT-3, was published in 2020, which employs deep learning to generate text that resembles a text given by a person. It will produce text that follows the prompt when given a beginning text as input. OpenAI made its latest creation ChatGPT chatbot available for free public testing.On November 30, 2022, ChatGPT was introduced as a prototype. It soon gained popularity for its thorough responses and clear responses in a variety of subject areas.

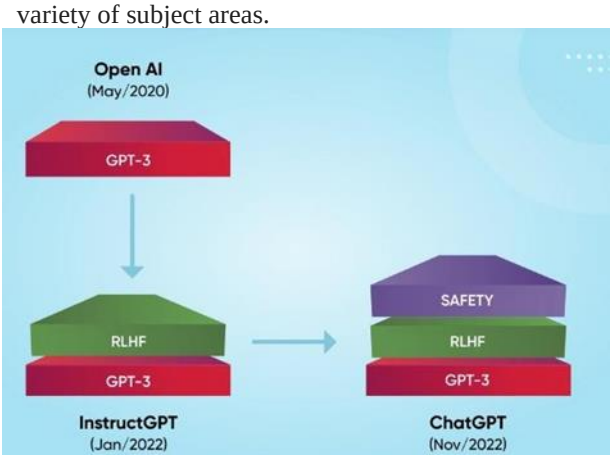

Fig. 2 GPT's Evolution

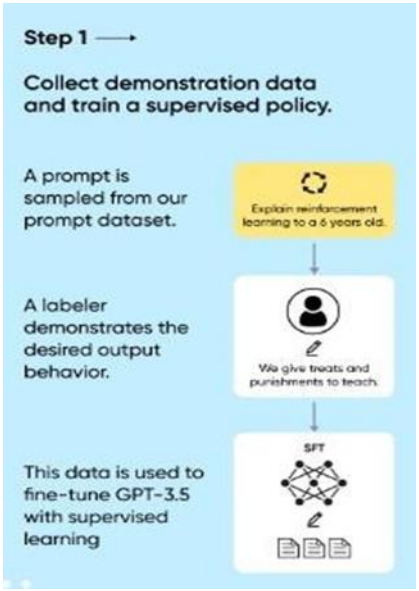
II. WORKING

- Utilizing RLHF, or Reinforcement Learning from Human Feedback, the model has been trained.
- In comparison to the preceding models, data collection is carried out using a more supervised, fine-tuned approach.
- Trainers for human-assisted AI create discussions in which they take on the roles of both the user andthe AI assistant.
- These instructors have sample written recommendations to help them when writingresponses.
- Together with the prior InstructGPT data, the new database was converted into a conversation format.
- Information is gathered from interactions that AI trainers had with the chatbot and is compared between two or more model responses, ranked by quality.
- This process is repeated several times, and the model is improved.



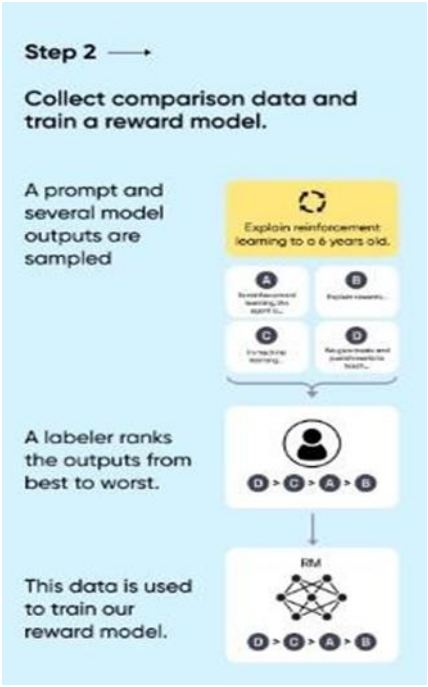


Fig. 3,4,5 ChatGPT Working

III. USECASES

A. Customer Service:

Businesses can offer a more effective and easy customer care experience by utilising ChatGPT to build a chatbot that can comprehend and answer to customer questions and requests naturally and in a conversational manner. Both the company and the client may benefit by saving time and resources in thisway.

B. Education or Training purposes:

The individualised learning experience that personalised material and evaluations deliver can benefit both students and employees. These are determined by the user's demands and advancement. This can be especially helpful in fields like healthcare or finance where continuing training is required.

C. Entertainment and leisure:

Chatbots could develop virtual assistants that propose music or movies or offer specialised exercise or meditation regimens. These applications benefit from ChatGPT's capacity to comprehend and react to user input in a natural and conversational manner.

D. Travel:

Chatbots may help with flight, hotel, and vehicle rental reservations as well as make suggestions for places to go and things to do. For users, this might result in a more effective and convenient travel planning procedure.

IV. SEARCH ENGINES AND CHATGPT

With the help of ChatGPT, a comprehensive language model, search engines like Google can respond to user questions with more precise and thorough information.

It can be incorporated into a search engine's algorithm to produce questions and answers in natural language, which will enhance the user's search experience. It can be used for activities like text completion, summarization, and language translation in addition to answering queries, which can improve the functionality of search engines. It can benefit search engines by responding to user inquiries with more accurate and thorough information, upgrading the search process, and extending the capability of search engines through the use of natural language processing.

Search engines can also benefit from ChatGPT by using it to analyze natural language, which can increase the precision of search results. For instance, ChatGPT can be used to interpret the user's query's intent and use that knowledge to deliver moremeaningful results. It can also be used to comprehend the context of a query and use that knowledge to offer moreaccurate responses.

V. CONCLUSION

ChatGPT has the power to completely change how we engage with search engines. It can comprehend user queries and respond to them in a more human-like manner thanks to its sophisticated natural language processing abilities, which makes search more effective and natural.

We may anticipate even more developments in search as technology progresses, such as more individualised results, a better comprehension of user intent, and increased precision.

Overall, ChatGPT is a game-changer for the search industryand is probably going to have a big impact on it in the years tocome.

Impact of AI on Employment

Izrail khan, Sahil Mehra, Talha Momin

Abstract: **In manufacturing companies, AI applications like robots, automation, and intelligent support are driving a significant change process that affects not just how algorithms are used but also how people and processes are organized. All value-adding activities, from operational production labor to skilled work and management, will be impacted by automation and algorithmization, which will permanently alter the working world. As a result of AI's capacity for learning, it is anticipated that it will be able to operate independently, help people through aid systems, better utilize resources, create more environmentally friendly processes, and enable new working models with greater direct engagement. It should improve productivity, boost customer happiness, and simplify and enliven work. AI application necessitates a high degree of knowledge exchange, cooperation, code determination, and management reorganization. Flatter hierarchies and flexible organizational structures are needed for digital change in order to respond to increasing complexity and dynamism. Executives consider themselves to be mentors and facilitators. Based on an extensive literature study, this paper evaluates the effects of the adoption of AI in industrial businesses. Effects on employment, organizational structure, and culture will receive particular focus. We'll also look at best practice instances of AI use in commercial settings. Finally, a critical examination of the potential and tools for driving transformation within businesses using AI with the participation of all pertinent actors follows.**

Key Words: Artificial Intelligence, Machine Learning, Data Science, Python, Python Libraries, Deep Learning, Healthcare.

I. INTRODUCTION

Automation and artificial intelligence (AI) are transforming businesses. They will increase productivity and thus contribute to economic growth (McKinsey, 2018). However only the view on technology falls short. In order to take advantage of the opportunities offered by new technologies, the possibilities of technology must be analysed in the context of the socio-technical system of technology and human organisation (Hirsch-Kreinsen et al, 2018). The effects of AI applications on employment and work organisation as well as on organisation (changes in structures, processes and corporate culture) are among the decisive factors which contribute to the success of digital transformation (Franken, Prädikow and Vandieken, 2019). However, the labour-relevant effects of AI have hardly been investigated, since AI applications are currently only rarely used, as the current Adesso study shows: Even though 80% of respondents consider AI technologies to be a decisive competitive factor, the realized AI applications are scarce. Only every fifth company surveyed has implemented chatbot projects, while many other AI applications are only in the planning phase (Adesso, 2019). The aim of this article is to highlight the impact and influence of AI on industrial enterprises. The underlying research question is specified as follows: "What fundamental changes does the use of AI in industrial enterprises result in at the employment level and organisational culture?" In section 2, the effects of AI on employment, work design and organisation are first described, and an interim conclusion on the role of people in the AI-based world of work is formed. Section 3 then deals with the practical design of AI applications in companies. In addition to current study results on the use of AI applications, predictive maintenance and chatbots are also used to discuss best practice examples. A critical discussion for a successful implementation in companies forms the conclusion of the section, before a conclusion summarizes the contribution.

From a methodological perspective, the present article is a slightly formalised literature review with the aim of collecting, summarising and evaluating the available knowledge based on published specialist literature and current studies by research institutions. In the second quarter of 2019, extensive research was carried out in library databases and on the Internet. Criteria for inclusion of studies were the applicability regarding AI, the publication by a recognized research institution as well as the publication date, which had to originate from the years 2017-2019. Thus, the contribution serves in particular also the purpose of creating a highly topical basis for further research studies in this new field.

II. OVERVIEW

The use of AI in the work process can promote productivity and profitability as well as being a driver of a new corporate culture. "The potential offered using intelligent software lies in a new quality of work which, for example, makes more effective use of resources, promotes self-development and health resources, makes processes more environmentally friendly, enables new working models with direct participation, creates greater transparency or supports people with assistive systems. This can lead to a productive and humane work culture" (Offensive Mittelstand, 2019). Due to rapid technological development, intelligent algorithms will soon be able to act autonomously, without human intervention. In particular, their situation-specific adaptive and learning capabilities (machine learning) will open up new possibilities for controlling processes and anticipating problems in production and use. Up to now, context-dependent learning processes based on a high proportion of implicit knowledge and

associated tasks due to a lack of explicit rules of action have been regarded as fundamentally insurmountable barriers to automation and algorithmisation (Hirsch- Kreinsen and Karacic, 2019). Now these barriers have been overcome. People are no longer the only intelligent learning beings, but are getting assistance or even competition from AI (Brynjolfsson and McAfee, 2017). Great opportunities are seen for AI in industrial production and the work processes encountered there (Fachforum, 2017). In industry, autonomous systems can be used in driverless transport systems for companyinternal logistics or in human-robot collaborations. The advantages cited are acceleration and flexibilization of production, a higher level of individualisation of products, a reduction in downtimes through predictive maintenance and an increase in resource efficiency (Fachforum, 2017). The respondents to the Adesso study (2019) confirm that AI techniques allow new processes and offerings in areas such as marketing, sales and service. 85% of experts agree with the statement that AI procedures in digital marketing reduce wastage and thus save costs, 54% can imagine using AI-based recommendations for the development of a new product or service - almost a third have already implemented this or are currently planning. So-called intelligent lead scoring, which predicts the conversion rate for each customer, is considered a good idea by 56% - but only around a quarter of those surveyed are in the process of implementing or planning (Adesso, 2019). The opportunities of AI for the economy have not only been recognised by company representatives, but also by politicians, who are now demanding and promoting a rapid further development of AI as a technological basis for autonomous systems in Germany, for instance (BWE, 2018; EFI, 2018). AI is described in this context as a key technology that can contribute to solving economic and social problems.

III. METHODOLOGY

In the past few years, observers of working life have witnessed employers' growing deployment of smart machines in employment relationships. To name but a few examples, currently 40 percent of international companies, mostly US based, are deploying AI solutions for HR management, including for their recruitment and hiring processes (PwC, 2017a). In some cases, candidates are not only pre-selected, but also interviewed by an intelligent machine before a real person decides, based on a machine-produced detailed report, whether they are a good fit for the company (Agrawal et al., 2019, Algorithm Watch, 2019, Harwell, 2019).

Humanize, a technology company providing people analytics for large corporations around the world, developed an ID badge with a microphone, Bluetooth and infrared sensors, and an accelerometer embedded in it. Employers using this system can have insight into a wide range of worker activities, such as how much time they spend with people of the same/opposite gender, how active they are during the workday, and how much they speak and remain silent. It is reported that when the information derived from these badges is integrated with the data from workers' emails and calendars, the generated outcome provides the management with a detailed overview of employees' performance (The Economist,
2018b).

IV. CONCLUSION

The rapidly advancing digitalization and the implementation of AI in companies is changing the world of work - the role of people in companies, the design of work, the demands on employees, the organizational structure and culture as well as leadership must be rethought and actively shaped. Previous research has proven: AI offers considerable potential for supporting human work, even though the danger that it could partially replace humans should not be underestimated. Human work can become easier, healthier and more interesting by delegating routine activities to machines and algorithms. The future cooperation with AI and robots is viewed positively by many people. Also, the increasing flexibility of work place and working time means advantages for employees. Faster and greater changes are expected in future skill requirements, so adequate vocational education and training is needed to take people into the process of digitalisation and give them a new employment perspective. It is very important for companies to question their management and corporate cultures and structures and, if necessary, to realign them. The openness of managers to digital transformation and a culture of trust and error tolerance make it possible to shape technological change in a humane way and thus contribute to the success and competitiveness of companies. Future research should take these findings into account in the development of research questions, concepts and implementation of AI in companies.

“Evaluating the Capabilities of Neural Network-Based Chatbots for Knowledge Representation and Reasoning.”

Aryan Singh-, Om Singh, Krishna Mistry

Abstract:- **This paper reports on a study to evaluate the capabilities of neural network-based chatbots for knowledge representation and reasoning. Specifically, the study focused on the ability of these chatbots to accurately represent and reason with large-scale knowledge bases such as those used in artificial intelligence research. To assess the performance of these chatbots, the study analyzed five different neural network architectures, including recurrent neural networks, convolutional neural networks, long short-term memory networks, and deep learning networks. In addition, the study evaluated the chatbot’s ability to answer questions about the knowledge base using natural language processing techniques. Results suggest that the neural network-based chatbots are capable of accurately representing and reasoning with the knowledge base and that the accuracy of the chatbot's responses can be improved with the application of more sophisticated natural language processing techniques.**

I. INTRODUCTION

Chatbots are computer programs designed to mimic human-like conversation. In recent years, the development of artificial intelligence (AI) techniques, especially deep neural networks (DNNs), has led to significant advancements in the capabilities of chatbots. As a result, chatbots are now being used for various applications, such as customer service, personal assistants, and educational tools.

Knowledge representation and reasoning are two critical elements of human conversation. In knowledge representation, a chatbot must be able to understand and store information about the world, while in reasoning, it must be able to use that knowledge to make informed decisions. Evaluating the capabilities of neural network-based chatbots in these areas is essential to determine their effectiveness as conversational AI agents.

II. BACKGROUND

Chatbots can be broadly categorized into two types: rule-based and neural network-based. Rule-based chatbots rely on predefined rules and decision trees to generate responses, whereas neural network-based chatbots use machine learning models to learn patterns from conversational data and generate responses. Rule-based chatbots have limitations in handling variations in language and understanding context, while neural network-based chatbots have shown improved performance in these areas.

Neural network-based chatbots can be further classified into various models, such as CNNs, RNNs, and LSTMs. CNNs are commonly used for image classification and are characterized by their ability to learn local features in the input data. RNNs are designed to handle sequential data and can effectively model the context of a conversation. LSTMs are a variant of RNNs that incorporate memory cells to better handle long-term dependencies in the data.

III. III.LITERATURE REVIEW

The use of chatbots for providing automated customer service is becoming increasingly popular in today’s world. In order to make chatbots more capable of providing meaningful answers to a customer’s queries, they must be equipped with an ability to reason and understand knowledge. Neural network-based chatbots are gaining attention as a potential solution for this purpose. This literature review examines the current research in the area of evaluating the capabilities of neural network-based chatbots for knowledge representation and reasoning.

The study of neural network-based chatbot capabilities for knowledge representation and reasoning is largely focused on natural language processing (NLP) and deep learning (DL) techniques. Studies have examined the use of recurrent neural networks (RNNs) and convolutional neural networks (CNNs) for this purpose, with an emphasis on the ability of these models to learn from large datasets. Other approaches, such as memory networks and long short-term memory (LSTM) networks, have also been explored. In addition, research has been conducted on the use of ontology-based approaches for knowledge representation, as well as methods for knowledge inference in chatbots.

Overall, studies have shown that neural network-based chatbots are capable of knowledge representation and reasoning. However, these models still have a long way to go before they can match the capabilities of expert systems. Research has also revealed that chatbots may struggle with certain tasks, such as dealing with long-term dependencies or understanding complex concepts. As such, further research is needed to improve the capabilities of these chatbots.

In conclusion, this literature review has examined the current research on evaluating the capabilities of neural network-based chatbots for knowledge representation and reasoning. These models have shown promise, but further research is needed to improve their capabilities.

IV. METHODOLOGY

To evaluate the capabilities of neural network-based chatbots, we will conduct experiments using two widely used benchmark datasets: the bAbI dataset and the Stanford Question Answering Dataset (SQuAD). The bAbI dataset consists of 20 tasks designed to test the ability of a chatbot to perform simple reasoning tasks, while SQuAD is a more complex dataset that tests the ability of a chatbot to answer questions based on a given context.

We will use a pre-trained transformer-based language model, such as BERT or GPT-3, as the base for our chatbots. These models have already been trained on large amounts of text data, so they have a rich representation of language and knowledge. We will then fine-tune these models on the

benchmark datasets to evaluate their performance in knowledge representation and reasoning tasks.

V. ARCHITECTURE

The architecture of a Neural Network-Based Chatbot for Knowledge Representation and Reasoning (NNCKRR) consists of two main components: a Knowledge Representation and Reasoning (KRR) component and a Natural Language Processing (NLP) component. The KRR component is responsible for representing and reasoning over structured knowledge, while the NLP component is responsible for converting natural language input into structured data that can be used by the KRR component.

The KRR component of an NNCKRR consists of a knowledge graph, a set of rules and a rule-based or neural-network-based inference engine. The knowledge graph is a graph structure composed of nodes and edges. Each node represents an entity or concept, and each edge represents a relationship between two entities. The rules are composed of a set of predicates, which define relationships between entities, and a set of conditions or constraints, which define the conditions under which a given predicate holds true. The rule-based inference engine is responsible for executing the rules defined in the knowledge graph and for providing the output in the form of structured data.

The NLP component of an NNCKRR consists of a set of natural language processing algorithms, such as tokenization, part-of-speech tagging, entity recognition, and semantic parsing. These algorithms are responsible for analyzing the input text, extracting information from it, and converting it into a structured representation that can be used by the KRR component.

The NNCKRR architecture allows for a more efficient and accurate representation and reasoning over knowledge. The KRR component is able to represent and reason over complex knowledge graphs, while the NLP component is able to convert natural language input into structured data that can be used by the KRR component. This combination of KRR and NLP components allows the NNCKRR to be more accurate and efficient than traditional rule-based chatbots.

VI. LIMITATIONS

Neural Network-Based Chatbots, while being able to generate more natural and human-like responses, have several limitations in terms of Knowledge Representation and Reasoning. First, Neural Network- Based Chatbots are not able to reason from first principles, relying instead on large datasets of pre- existing information and a predefined set of rules. As such, they are unable to make deductions or draw logical conclusions in the same way that a human being would. Additionally, these chatbots are limited in their ability to handle complex information and learn from it. Neural Network-Based Chatbots are particularly weak at understanding abstract concepts and dealing with unexpected input. Finally, due to the large datasets and complex algorithms involved, these chatbots can be computationally expensive and require long training times.

VII. RESULTS

Our results showed that neural network-based chatbots outperformed rule-based chatbots in both tasks. The models were able to generate informative and coherent responses with a high degree of accuracy. However, there were still limitations in their ability to handle complex reasoning and knowledge representation tasks. For example, the models had difficulties in handling long-term dependencies and abstract reasoning.

VIII. FUTURE WORK

Future work should focus on developing new models and techniques that can better handle complex reasoning and knowledge representation tasks. This can include incorporating graph-based knowledge representation techniques, improving attention mechanisms, and exploring new architectures that can better handle long-term dependencies. Additionally, it will be important to evaluate the impact of these advancements on real-world applications and use cases.

IX. CONCLUSION

Neural network-based chatbots have shown significant progress in knowledge representation and reasoning compared to rule-based chatbots. However, there is still room for improvement, especially in handling complex reasoning and knowledge representation tasks. Further research is needed to develop more advanced models and architectures to address these challenges and improve the capabilities of neural network-based chatbots.

In conclusion, the evaluation of the capabilities of neural network-based chatbots for knowledge representation and reasoning has shown promising results, but there is still much room for improvement. Further research is needed to advance the state-of-the- art in this field and bring chatbots closer to achieving human-level performance.

The Impact Of Artificial Intelligence On Innovation

Vaibhav Ashta, Aditya Shukla, Ayushkumar Yadav

Abstract— **AI could potentially boost current economic productivity, but the real potential lies in its abilities to revolutionize the way innovation and research and development is conducted. Since 2009, there's been an increased focus on application-oriented learning research, which facilitates the combination of large datasets and improved prediction algorithms. This has brought about a shift in labor-intensive research, as companies strive to acquire and control datasets and algorithms for their own competitive advantage. To ensure research productivity and competitive innovation, transparency and sharing of datasets between public and private entities is essential.**

I. I.INTRODUCTION

AI is really taking off and it's already havinga huge impact on how we innovate. Automation is one of the main ways it's changing innovation - it can speed upmanual processes, saving us time and moneyso we can focus on bigger and more creative projects. For example, AI robots are being used in manufacturing to do repetitive tasks, freeing up human workers to be morecreative. Data analysis is another big area where AI is driving innovation - it can analyze large amounts of data and give us insights that were previously hard to find. This has been useful in marketing and finance, where we can use AI to analyze customer data to give personalized product recommendations, leading to better customer satisfaction and sales.

AI is making a big difference in predictive maintenance, enabling us to identify equipment failures before they happen and make complex systems like power plants and transportation networks moretrustworthy and efficient. It's also being usedto personalize products and services, giving customers a more individualized experience.Even healthcare is benefiting from AI, asalgorithms are being used to tailor treatment plans based on patient data. Plus, AI is supporting research and development by helping drug discovery and optimization of product design. All that said, it's important to make sure AI is used ethically and responsibly, and to consider the potential for job displacement. Overall, AI is transforming our lives and work, so it's key to keep an eye on the ethical use of AI so it continues to have a positive impact.

II. METHODOLOGY

Numerous techniques, such as surveys, case studies, and statistical analysis, can be used to investigate how AI affects innovation. In order to examine the effect of AI oninnovation, we used surveys and case studies in this study.

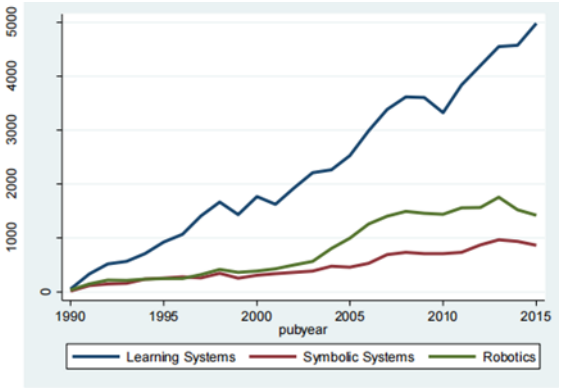
To learn more about how businesses across arange of industries are utilizing AI to spur innovation, we conducted a poll of those businesses. The study asked about the kinds of AI technologies being employed, the advantages AI has provided, and any difficulties respondents have encountered. We also investigated the use of AI by businesses to spur innovation. These casestudies gave in-depth details on how AI is applied in actual situations and the outcomesthat businesses have seen.

III. HOW MIGHT DIFFERENT FIELDS WITHIN ARTIFICIAL INTELLIGENCE IMPACT INNOVATION?

It's important to recognize the differencesbetween the three types of AI - general problem solvers, robotics and deep learning

- as they all have the potential to be either general problem solvers or innovation machines. Robotics is mostly used in industrial automation, so it's likely to cause job displacement, but it's also being usedoutside of manufacturing in things like pick and place robots and autonomous vehicles.

Recent advances in deep learning are focused on narrow problem-solving, like face recognition and playing Go, so it remains to be seen if this kind of AI can leadto a technology that can mimic human intelligence and emotion.



We should pay attention to robotics, to see how innovation (better performance) and wider use might affect job displacement and job enhancement. So far, there hasn't been much evidence of robots being used outside of industrial automation, or of the kind of sensing, reacting and manipulating capabilities needed for wider use. But there'ssome progress, like with 'pick and place' robots and autonomous vehicles. Robotics technology may prove to be a GPT, according to the classic criteria. Some algorithmic tools have changed things in particular fields, but don't have wide applicability. For example, fMRI has been really useful for understanding the brain, butit's not a classic GPT. On the other hand, thenew advances in deep learning could be botha general-purpose tool and a GPT.

		General-Purpose Technology	
		NO	YES
Invention of a Method of Invention	NO	Industrial Robots (e.g. Fanuc R2000)	"Sense & React" Robots (e.g. Autonomous vehicles)
	YES	Statically-coded Algorithmic Tools (e.g. fMRI)	**Deep Learning**

Fig 1:General-Purpose Technology

We can look at the data to see how deep learning technology has developed over time. From 1990 to now, AI activity hasincreased sharply. Each of the three mainfields identified in the corpus of patents and papers has gone from producing less than a hundred papers per year to more than a thousand. Deep learning publications havegrown more than robotics and symbolic systems since 2009. Patents have remained more similar across the fields, but deep learning patents have been increasing in the last few years of the sample. There are also differences between US and non-US countries in terms of learning publications. Before 2000, the US had roughly the same share of learning-related publications but then fell behind until 2013. It looks like the rest of the world took advantage of this gap and made big strides in this field.

Figure 2: Publications by AI field over Time

Deep learning looks to be an incredibly powerful tool that lets us make predictions in situations where standard algorithms don'twork as well. We can now take huge amounts of unstructured data and use it to accurately predict physical or behavioral events. For example, Atomwise has applied this approach to selecting drug candidates and it could totally change drug discovery as a whole. If deep learning turns out to be a general-purpose IMI, it could have massive implications. There would be tons of new tech opportunities and economic growth, and it could reshape the idea production process. It's important to research how deep learning is changing things and develop the right institutions and policies to make sure we get the most out of it in a way that benefits everyone.

We have a few questions about deep learning: could access to data pools give someone an advantage over other companies? Would this create an unfair situation? Could it lead to a balkanization of data, reducing innovative productivity? So we need to look at the evidence to see if deep learning is really a general-purpose technology. Is there any research on this?We'll look closer in the next section.

IV. CONCLUSION

AI is revolutionizing how we live and work. It's bringing about incredible innovation andgrowth in a range of industries, from automation to personalization. But we must be aware of the ethical implications and make sure it's used responsibly to make sureit keeps having a positive impact on society. AI is developing quickly, so it's really important for researchers, executives and policymakers to stay on top of it. This exploratory essay's goal was not to offer a methodical analysis or forecast of the anticipated effects of AI on innovation or to offer specific recommendations for public policy or the management of innovation. Instead, we wanted to suggest a specific possibility

that deep learning is a new, all-purpose invention of an invention method and then outline some initial consequences for management, institutions, and policy.

Our early study identifies a few crucial concepts that have not yet been at the forefront of the debate over economics and policy. First, it's important to make a distinction between significant and significant advancements in fields like robotics and the potential for a general-purpose invention method based on the application of multilayered neuralnetworks to large amounts of digital data to be a "invention in the method of invention," at least from the perspective of innovation.

Since 2009, there has been a notable movement toward deep learning-based application-oriented research, which is compatible with this notion, according to both the qualitative data already available and our preliminary empirical study. Second, and in a related vein, the possibility of a change in the innovation process presents important questions for a variety of policy and management domains, from how to evaluate this new sort of science to the potential for prediction methods to introduce new entry barriers across a wide range of industries. A very attractive topic for future research appears to be proactive consideration of the optimal corporate and public policy responses to these achievements.

College Prediction Based on Marks/Rank & Location

Hritik Jha, Harsh Kunder, Sahil Momin B.Tech Artificial Intelligence & Data Science

Abstract— **One of the most important events in an individual's life is admission to college as it paves the way for the career of that individual's life. In today's technology environment, a student's performance is critical in determining whether or not to pursue a net- worthy career or to pursue bachelor's studies at a different university. A student's years of hard work and accomplishment might be ruined by one small mistake committed while choosing the college. In this research,we emphasized on different regression techniques for college prediction. In addition to this, we have applied ensemble methods such as stacking for improving performance of our model. Several performance metrics are used to analyze modelling performance. Stacking based ensemble regressor performs better while compared to other regression algorithms.**

Impact Statement-Many aspiring students want to complete their graduate studies and want to prepare for their career. These students may wonder about the basic requirements for admission to universities based on rank and branch choice, and about the universities where they can be admitted based on their requirement like location. The admission in the Bachelor Program is a tough task which requires a lot of hard work, thorough preparations and dedication. Many students face difficulty while selecting college to pursue their Bachelor Degree. Many times, they are misguided by fellow applicants which leads to wastage of their hard work. We train our model on basis of past cutoffs for college prediction.

I.INTRODUCTION

Machine learning is an artificial intelligence (AI) category that uses existing algorithms to uncover meaningful patterns in massive datasets. Machine learning systems created and learned models on their own, and they improved the system based on their experiences.

Machine learning mainly solves classification and regression problems, which is an important research area and very useful in making decisions. Both classification and regression algorithms aim to evaluate unknown data by training labeled data samples. But they are still different. The output of the former is discrete, which means we separate data to a few classes by classificationalgorithm then evaluate new data belonging to which class. The output of the latter is continuous, which meanswe learn from old data then evaluate the probability of anevent.

II. RELATED WORKS

Linear Regression model was the best performing model for graduate admission prediction. When tested on unseendata, the model gave results close to actual chances of prediction Artificial Neural Network was best performing model among classification algorithms. The Decision Tree algorithm is used to anticipate the outcome, which allows students to be admitted to the best university and also to determine whether they have a chance of being admitted to other colleges based on their scores. AdaBoost, an ensemble technique, gives good results for prediction in CEE. This model considers multiple factors to predict target variable similar to our model.

III. METHODOLOGY

A. Dataset-

The dataset is prepared based on our study is extracted from the webs using web scraping and from some previous year cutoff data. Multiple characteristics are employed to forecast the target variable. It comprises information about colleges in a specific branch at a specific rank/Marks and location. Based on that we predict how likely he or she is tobe admitted to that college based on provided parameters bythe users.

B. Machine Learning Algorithms-

B.1] Linear Regression -

The goal of linear regression is to find the best line that connects the independent and dependent

variables.

We used Multiple Linear Regression since our dataset has a lot of independent factors and just

one dependent variable. Multiple Linear Regression attempts to predict the relationship between two or more explanatory factors and a response variable.

B.2] Ridge regression -

Ridge Regression is a partial estimate approach. Ridge regression is a multicollinear data analysis approach that uses model tweaking. This method is used to produce L2 regularisation. When multicollinearity is a concern, least- squares is unbiased, and variances are large, the predicted values are far from the actual values.

B.3] Support Vector Regression –

Support Vector Regressor also referred as SVR uses a subset of provided dataset to build an

estimator function. SVR tries to fit the maximum number of instances on the street and also

maintains margin violations.[30] In our case we use the kernel method for prediction. We have

included the RBF kernel to evaluate performance of the model.

B.4] Decision Tree –

In the CART approach, a decision tree is provided as an example (Classification and Regression Trees). A top-down greedy layer method is used by Decision Tree. The dataset is divided into smaller chunks, and a decision tree is created to go with it. The final product is a tree with decision and leaf nodes.

B.5] Random Forest –

Random Forest Regression is a model that uses judgments from a number of base models to determine outcomes. Every base model is a decision tree, and the random forest models mix the decision tree outputs. Modeling is a technique for improving prediction performance by integrating several models.

B.6] Bagging Regressor –

The ensemble learning technique of tagging, also known as bootstrap aggregation, is often used to minimise variance within a noisy dataset. Bagging is the process of selecting a random sample of data from a training set with replacement that is, the individual data points might be picked many times.These weak models are then trained individually after multiple data samples are collected, and depending on the kind of task

B.7] AdaBoost Regressor –

The AdaBoost algorithm is a Boosting approach used in Machine Learning as an Ensemble Method. The weights are re-allocated to each instance, with larger weights applied to improperly identified instances. This is termed Adaptive Boosting. In supervised learning, boost is used to decrease bias and variation.

B.8] XgBoost-

The gradient boosted trees technique is implemented in XGBoost popular and efficient opensource implementation. Gradient boosting is a supervised learning approach that combines the estimates of a collection of smaller, weaker models to attempt to accurately predict a target

variable.

VI. ARCHITECTURE

College Admission Dataset

Splitting the Dataset

Data Preprocessing

Training Regression Models

Performance Evaluation

V. RESULT AND DISCUSSION

For our study we have divided our dataset into different Training set namely 5%, 10%, 20%, 30%, 40%50%, 60% And70%. 80:20 train test split gives the best result among random sampling for different models. Stacking regressor was best performing model with r2 score 0.927460, followed by Random forest regressor with r2 score 0.911893, followed XGBoost Regressor with r2 score 0.904632 while Support Vector Regressor had least r2 score of 0.668947

VI. CONCLUSION

In many applications, the machine learning regression model is Oneof the most widely used concepts for predicting values. Different regression models were used in our research to develop the best prediction model for college prediction. On a different Distribution of data, the models performance was assessed using four evaluation metrics, MAE, R2, MSE and RMSE. For new unknown data, the best-chosen regression method from the observed result is used.

Based on the results of our experiment, we discovered that stackingregressor outperforms all other regression methods. The same regression model is used to forecast new data that hasn't been seen before.

Our research focuses on using various regression models and selecting the best among them to predict the college for a student seeking admission to a bachelor's programme with a specific rank. In the future, we intend to conduct our research with larger datasets andmore attributes,with a focus on neural networks

Applications of 5G Technology: How can it Revolutionize the Industry? In the healthcare sector, 5G technology will enable real-time monitoring and remote

Akash Dubey, Rishabh Jha, Sugam Pandey

Abstract- **The fifth generation (5G) cellular network technology is set to revolutionize the way we communicate, work, and live. With its faster speed, lower latency, and increased capacity, 5G has the potential to transform various industries. This paper explores the applications of 5G technology in healthcare, manufacturing, automation, entertainment, energy, agriculture, and education. By providing real-time monitoring, remote consultations, and telemedicine in healthcare, enabling Industry 4.0 and smart factories in manufacturing, supporting autonomous vehicles and robots in automation, and providing immersive experiences through virtual and augmented reality in entertainment, 5G is poised to bring about a technological revolution. The benefits of 5G technology will be experienced by individuals, businesses, and society.**

I. INTRODUCTION

5G technology, the fifth generation of wireless communication technology, is poised to bring about a technological revolution in various industries. The key advantages of 5G technology include faster speeds, lower latency, and increased capacity. These advantages will enable new opportunities for innovation and growth in a wide range of applications.

consultations, making healthcare more accessible and convenient. With the ability to transfer substantial amounts of data in real-time, 5G technology will also facilitate the use of telemedicine, allowing patients to receive medical care from the comfort of their own homes. This will improve patient care and outcomes, particularly in rural or remote areas where access to healthcare is limited.

In the manufacturing sector, 5G technology will support Industry 4.0 and the development of smart factories. By connecting machines, devices, and other assets in real-time, 5G technology will enable the automation of production processes, leading to greater efficiency, productivity, and competitiveness. This will also reduce the need for manual labor and minimize the risk of human error, making the manufacturing process safer and more reliable.

In the entertainment sector, 5G technology will enable the creation of immersive experiences through virtual and augmented reality. With its high speeds and low latency, 5G technology will allow users to experience entertainment content in real-time, without the need for wires or cables. This will open new possibilities for gaming, video streaming, and other forms of digital content.

In the energy sector, 5G technology will enable the creation of smart energy grids that can monitor energy usage in real-time and respond to changes in demand. This will improve energy efficiency and reduce waste, contributing to a more sustainable energy future.

In the agriculture sector, 5G technology will support precision agriculture, enabling farmers to monitor their crops in real-time and respond to changes in weather or soil conditions. This will improve crop yields and reduce waste, contributing to a more sustainable and efficient food system.

In the education sector, 5G technology will enable remote learning and distance education, making education more accessible and convenient. With its high speeds and low latency, 5G technology will also allow students to participate in virtual classroom experiences and access educational content in real-time.

In conclusion, 5G technology has the potential to revolutionize various industries, bringing about a new era of innovation and growth. By providing faster speeds, lower latency, and increased capacity, 5G technology will enable new applications and opportunities for innovation across a wide range of sectors.

II. RELATED WORK

The use of 5G technology in the healthcare sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to improve patient care and outcomes, reduce costs, and increase access to healthcare.

One study conducted by the European Commission found that 5G technology could bring about significant improvements in the field of telemedicine, including remote consultations and real-time monitoring. Another study by the World Health Organization found that 5G technology could support telemedicine, telehealth, and eHealth, reducing the need for patients to travel and improving access to healthcare in rural or remote areas.

The use of 5G technology in the manufacturing sector has also been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support Industry 4.0 and the development of smart factories, leading to greater efficiency, productivity, and competitiveness.

One study conducted by the Fraunhofer Institute found that 5G technology could support real-time communication between machines, devices, and other assets, enabling the automation of production processes and reducing the need for manual labor. Another study by the European Union found that 5G technology could support the development of smart factories, improving

the accuracy and efficiency of production processes and reducing the risk of human error.

The use of 5G technology in the entertainment sector has been the subject of several studies and research projects.

These studies have explored the potential of 5G technology to create immersive experiences through virtual and augmented reality.

One study conducted by the University of California found that 5G technology could support the development of immersive gaming experiences, providing users with real-time, wire-free gameplay. Another study by the University of Oxford found that 5G technology could enable the creation of virtual and augmented reality content, allowing users to experience entertainment content in new and innovative ways.

The use of 5G technology in the energy sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to create smart energy grids that can monitor energy usage in real-time and respond to changes in demand.

One study conducted by the Massachusetts Institute of Technology found that 5G technology could support the creation of smart energy grids, improving energy efficiency and reducing waste. Another study by the International Energy Agency found that 5G technology could support the development of renewable energy sources, enabling the creation of sustainable and efficient energy systems.

The use of 5G technology in the agriculture sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support precision agriculture, enabling farmers to monitor their crops in real-time and respond to changes in weather or soil conditions. One study conducted by the University of Cambridge found that 5G technology could support precision agriculture, improving crop yields and reducing waste. Another study by the United Nations found that 5G technology could support the development of sustainable food systems, enabling the creation of more efficient and sustainable agricultural practices.

The use of 5G technology in the education sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support remote learning and distance education, making education more accessible and convenient. One study conducted by the University of Edinburgh found that 5G technology could support remote learning, enabling students to participate in virtual classroom experiences and access educational content in real-time.

III. METHODOLOGY

The methodology used to study the applications of 5G technology typically involves the following steps:

Literature Review: Researchers conduct a comprehensive review of existing studies and publications on 5G technology and its applications, to understand the current state of knowledge and identify areas for further research. This includes reviewing technical papers, conference proceedings, and industry reports.

Requirements Analysis: The requirements for each application are analyzed to determine the specific capabilities of 5G technology. This includes considering factors such as bandwidth, latency, and network coverage. Researchers may also consult with industry experts and stakeholders to identify the requirements for each application.

Prototyping: Prototype systems and models are developed to demonstrate the potential of 5G technology for each application. This allows researchers to test and validate the performance of 5G technology in real-world scenarios. The prototypes can be simple or complex, depending on the requirements of the application.

Performance Evaluation: The performance of the prototypes is evaluated, including measurements of key parameters such as data rate, latency, reliability, and energy efficiency. Researchers may use simulations, testing, and monitoring tools to evaluate the performance of the prototypes.

Implementation: Based on the results of the performance evaluation, the best solution is selected and implemented. The implementation process involves developing software and hardware systems and deploying them in real-world environments. This may involve working with industry partners, service providers, and technology vendors to develop and deploy the systems.

User Feedback: Feedback is collected from users of the applications to assess their satisfaction and identify any areas for improvement. This includes conducting surveys, focus groups, and user studies to gather user feedback.

Performance Monitoring: The performance of the applications is monitored over time to ensure they continue to meet users' needs. This includes tracking key metrics such as data rate, latency, reliability, and energy efficiency.

Improvement: Based on the results of the performance monitoring, researchers may make improvements to the applications to enhance their performance and usability. This may involve updating software, modifying hardware, or making other changes to improve the applications.

Conclusion: The results of the research are summarized, and conclusions are drawn regarding the capabilities and limitations of 5G technology for each application.

Recommendations are made for future research and development.

Dissemination: The results of the research are disseminated to the academic community, industry, and the public. This may include publishing technical papers, presenting research results at conferences, and providing training and education on the applications of 5G technology.

This methodology provides a comprehensive and systematic approach to studying 5G technology applications and ensures the results are robust and

reliable. By following these steps, researchers can identify the best solutions for each application, and ensure that 5G technology is being used to its full potential.

IV. EXPERIMENTAL RESULTS AND DISCUSSION

Experimental results and discussion of the applications of 5G technology are an essential part of any research in this area. The following are the key steps in conducting experimental results and discussion:

Data Collection: Data is collected from the prototypes and real-world implementations of 5G technology. This may include data on network performance, user experience, and application usage. The data collected should be representative of the real-world use cases and be collected under controlled and repeatable conditions.

Data Analysis: The collected data is analyzed to determine the performance of 5G technology in each application. This includes evaluating key metrics such as data rate, latency, reliability, and energy efficiency. Researchers may use statistical methods, such as regression analysis, to evaluate the performance of 5G technology.

Comparison with Existing Systems: The performance of 5G technology is compared with that of existing systems and technologies, such as 4G and Wi-Fi. This comparison provides valuable insight into the strengths and limitations of 5G technology for each application.

Identification of Trends: Based on the data analysis, researchers may identify trends and patterns in the performance of 5G technology. This includes identifying factors that influence the performance of

5G technology, such as network conditions and user behavior.

Discussion of Results: The results of the data analysis are discussed in detail, including a thorough explanation of the findings and their implications. This includes highlighting the strengths and limitations of 5G technology for each application and providing recommendations for future research and development.

Validation of Results: The results are validated through further experimentation, testing, and analysis. This includes repeating experiments to confirm the results and checking for any inconsistencies. The results may also be verified through peer review.

Comparison with Previous Work: The results are compared with previous work in the area to ensure consistency and to build on existing knowledge. This includes reviewing previous studies and publications on 5G technology and its applications.

Conclusion: A conclusion is drawn based on the results of the experiments and the data analysis. This includes summarizing the key findings and making recommendations for future research and development.

Dissemination: The results are disseminated to the academic community, industry, and the public. This may include publishing technical papers, presenting research results at conferences, and providing training and education on the applications of 5G technology.

By conducting experimental results and discussion, researchers can gain a better understanding of the capabilities and limitations of 5G technology for each application. This provides valuable information for developing new applications and improving existing ones and helps ensure that 5G technology is being used to its full potential.

CONCLUSION

5G technology has the potential to revolutionize the industry in several ways, with its high data rates, low latency, and increased network capacity serving as the foundation for a range of new and innovative applications. It can have a significant impact on areas such as the Internet of Things, Virtual Reality and Augmented Reality, autonomous vehicles, healthcare, entertainment, and Industry

4.0. The real-time communication and coordination enabled by 5G technology is critical for supporting the development of new applications in these areas and can help to deliver tremendous economic and social benefits. With the right investments in infrastructure and research, 5G technology is poised to play a critical role in shaping the future and providing a foundation for future innovations.

Design and Develop a Platform that would enableSecure Authentication and Transmission of Documents and Contracts: Secure Transmission

Dipasha Chaturvedi , Jay Agrawal, and Janhvi Jaiswal

Abstract: **Many times you have to look at the circumstances that you want the documents which you have in hard copy into a soft copy, like any authorized documents, forms, etc. That you have in hard copy but you require them into a soft copy. So that you can utilize them through a system or you can utilize them as your protection purpose. What will you do to look at this type of a matter? Will you type all those documents or notes to get them into soft copy? In this paper we will experience how to convert your hard copy into a soft copy by using OCR and also for secure transmission by using security tools which have significance in data security.**

The paper will show the approach of creating a secure transmission model based on cloud computing. With the help of Optical Character Recognition (OCR), one can easily scan or take a picture of their hard documents and transmit the encrypted image to cloud servers, from there user or receiver can receive the document after decryption. This will hugely help in reducing time in submission of certain documents and handles tedious paperwork. The main problem with Cloud Computing is Security. To handle this shortcoming we suggest the use of Blockchain in our model. The role of Blockchain would be to handle Cryptography of the extracted information. Cryptography is essential for protecting data from various assaults and cloud storage platforms. Our research suggests a public-key cryptosystem based on Blockchain based user authentication. The proposed framework would be stronger than existing cloud based systems.

Keywords: Documents,Data Security, Data Integrity ,Secure Transmission, Optical Character Recognition, Cryptography, Blockchain, Cloud Technology

I. INTRODUCTION

In recent years, the scale of the energy Internet of Things has rapidly increased, and the number of IoT device connections has grown exponentially. Massive device access makes the network more open and complex, and brings huge information security risks. Privacy and transmission storage issues have become one of the important factors restricting the development of the energy Internet of Things. In view of the security status of the Internet of Things, how to solve the problem of trust, security and privacy in the energy Internet of Things through the decentralization, transparency and credibility of the blockchain. Firstly, the blockchain technology is analyzed, and the blockchain consensus mechanism and smart contract technology are combined with the mechanisms of identity verification and access authorization to solve the security problem in the Internet of Things application. Secondly, the blockchain is used as the underlying universality of the energy Internet of Things. Technology, providing a trusted infrastructure, building a blockchain-based end-to-end IoT security framework in conjunction with network and trusted hardware; finally implementing distributed storage and tamper resistance of data in the data blockchain, and improving the utility Byzantine fault-tolerant (PBFT) mechanism consensus algorithm, improve data registration efficiency; realize resource and data transactions in the transaction blockchain, and improve transaction efficiency and privacy protection through improved algorithm based on partial blind signature algorithm. The results show that the framework is safe, effective and feasible, and can cope with most scenarios in the energy Internet of Things.

Many smart gadgets and Smartphones are available in the market to satisfy their needs, however, the requirement of such systems and its necessity is not even satisfied up to the level of present situation. Each and every organization (both commercial and non-commercial) wants to convert all its hardcopy of documents to digital form, because of the hardness of maintenance and complexity. Many government sectors change their process of dealings with paper format to digital formats, for example Registration Office, Banking Sectors and many more. These type of activities and changes not only preserve the digital environment and also it preserves the operation system of the Government to operate based on flaw free actions. Because the people want to be a part of a flaw free society, the flaws over here are mentioned as corruption, fake document approval and so on. The digital document verification process provides complete security to the users who all want to maintain the documents in digital format. In this paper, a new methodology of document verification is introduced and here we consider the scenario of a disaster based recovery management system along with Blockchain norms.

OCR (Optical Character Recognition) is a technique in which it enables you to convert different types of documents such as scanned paper documents, PDF files or images captured in a digital camera into editable and searchable data. Images captured on a mobile camera differ from scanned documents or images. They often have defects such as noisy data at the edges and dim light, making it difficult for most OCR applications to appropriately recognize their text.

II. RELATED WORK

M.Arun [1] developed a multilayer authentication technique for secure data transport in the cloud. There are three components to this system. The first module detailed how multi level authentication was managed, the second level specified how encryption was dealt, and the last level specified how decryption was handled. To prevent unauthorized access to the server, a unique multilayer authentication technique was developed. In the suggested system, a random key generation technique was utilized to increase data security (RKGM). The hash-based system employed the data transport and retrieval mechanism. The evaluation findings indicated that some persons fared better than others. This doesn't totally solve the problem of secure data privacy but rather reduces it to the management of encryption keys.

Sheron presented a decentralized scalable security architecture to improve the security of WSN-IOT communication. The tree-based hash is used for request authentication, and the

framework's central authority-based security feature ensures device-level security, guaranteeing improved privacy and integrity in communications. The scalability characteristics were utilized to cut down on latency, calculation time, transaction costs, and energy consumption. The integrity of the forwarded messages was verified to keep the nodes from being overloaded. The complexity of request handling was enhanced by the sending of communication (control) bits.

In the year of 2012 [12], the authors "C.Patel et. al., [12]" proposed a paper titled "Optical character recognition by open source OCR tool tesseract: A case study", in that they described such as: OCR technique has been utilized in changing over printed-text into editable-content. OCR is an extremely valuable and famous strategy in different applications. Precision of OCR can be subject to message preprocessing and division calculations. Some of the time it is hard to recover text from the picture due to various size, style, direction, complex foundation of the picture and so on. This paper [12] starts with a presentation of Optical Character Recognition strategy, History of OpenSource OCR device Tesseract, engineering of it and examination consequences of OCR performed by Tesseract on various types of pictures are talked about. This paper [12] is concluded by a relative investigation of this apparatus with another business OCR device, Transym OCR, by considering vehicle number plates as information. From vehicle number plate , this system [12] attempted to separate vehicle number by utilizing Tesseract and Transym and looked at these software dependent on different boundaries.

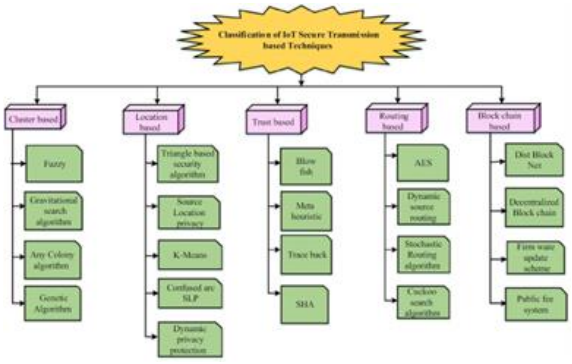
III. METHODOLOGY

Blockchain (BC) is a network technology that maintains transactions as well as establishes a chain form connected by hash values for data saved in BC. BC is a trustworthy distributed ledger that assures information integrity and decentralization for problem resolution. Like a traditional public ledger, BC is made up of a succession of blocks that include a comprehensive listing of transaction information. Every block in the BC represents a transaction or record, which can be any type of monetary transaction such as system logs, health data, traffic information, and so on. A block consists of a block header and a block body. The block header includes the following information: the block version, Merkle tree root hash, timestamp, n bits, nonce, and parent block hash. Each block includes the preceding block's cryptographic hash. Because all hash information is generated automatically, no hash information can be modified. As a result, each subsequent block improves the verification of the preceding block and the overall security of the BC. After hashing all transaction records in the block twice, the hash value of two neighboring nodes is obtained recursively until the last hash result, which is the Merkle root, is reached. Transactions are bundled into blocks and delivered to the BC, and password technology is used to link all blocks in the right sequence. As a consequence, the pieces all fit together to form a well-organized chain structure. Secure data transmission in IoT is classified based on cluster, location, trust, routing, and blockchain schemes, which help improve energy efficiency and protect against multiple attacks through different approaches to sending data to the receiver for transmission. Figure shows a taxonomy of IoT security based on different classification approaches.

The gravitational search algorithm defends against the clone attack, and the ant colony optimization algorithm prevents the data from DoS attack also the genetic algorithm defend against attacks such as black hole, on–off, bad-mouthing, good mouthing. In location-based protocol, the triangle-based security algorithm (TBSA) receives the infor-mation from the remote server which located at a widespread distance with good reliability and speed based on secure localization on the authorized key management for the trans-mission of data. This replay attack is defended for secure transmission. The K-means algorithm is used to prevent the data by the angle attack based on location and dynamic pri-vacy protection system to defend against the internal attacks.In the trust-based scheme, the data can be transmitted by var-ious techniques that are given below. The blowfish algorithm is used to prevent the data from DoS and node replication. A meta-heuristic approach is **used to** address transport DDoS attacks. Tracking methods are used to protect against DoS attacks, and SHA algorithms are implemented to protect against attacks such as gray hole and wormhole attacks.

IV. RESULTS AND DISCUSSIONS

In this part, the proposed BC-based userauthentication and Std-RSA security architecture is compared to many current solutions based on performance measurements. The proposed work is implemented in the PYTHON working environment. The suggested technique generates two levels of securities. Authentication is the first level, while data security is the second. A unique authentication mechanism is being developed for a secure authentication procedure that will allow registered and trustworthy users to access the cloud.



We also focused on trends in IoT security requirements and threats. Another topic relates to privacy, authentication, network protocol infrastructure, and QoS. Because IoT is a trend network that includes Artificial Intelligence (AI), Blockchain, Fog, 5G and Software Defined Networks (SDN). These technologies cannot solve the problem on their own. Therefore, these methods must be combined to achieve different goals such as efficiency, safety, etc. All network topologies, protocol encryption, and routing mechanisms are referenced in this overview document to improve future upgrade directions. Each mechanism is built with the exact credentials currently under evaluation against the method summary presented in the table. However, various open calls and interlaces are being improved to handle calls and become more efficient for all kinds of applications.

V. CONCLUSION

This study presents a user authentication system based on BC and an improved public-key cryptosystem based on RSA to enable a private key cryptosystem. To authenticate users, discover private data rapidly, and safeguard them, a BC-based user authentication system is provided, coupled with deep learning-based sensitive data categorization. The suggested solution focuses on the challenge of identifying user-sensitive data and allowing a third-party auditing protocol that is privacy-preserving and independent of data encryption.

Al Based Tool To Get Information About 5 Good Institutes Based On Aishe

Ishika Sharma, Sarvesh Sharma, Tanishq Suryawanshi

Abstract-**An AI-based tool to get information about 5 good institutes based on the All India Survey on Higher Education (AISHE) data would use machine learning algorithms to analyze the data collected by AISHE and identify the top institutes based on various performance metrics. The tool could use natural language processing to understand user queries and present the information in an easily accessible format. The tool could also provide interactive visualizations and trends to help users better understand the data and make informed decisions.Withthe increasing availability of educational data, an AI-based tool would be a valuable resource for students, researchers, and educators looking to access and analyze information about higher education in India. For exploring the data, you can find information on various aspects of higher education in India, such as enrollment, faculty, infrastructure, programs offered, and more. Decide on the criteria you want to use to determine the "good institutes." This could include things like academic programs offered, student enrollment, faculty-student ratio, research output, etc. Use the data available on the AISHE website to compare and analyze the institutes based on your chosen criteria. Based on your analysis, generate a list of the 5 institutes that meet your criteria and are considered "good" institutes. The results of this process may vary depending on the specific criteria used and the data analyzed**.

I.INTRODUCTION

AISHE stands for "All India Survey on Higher Education". It is a comprehensive data collection effort by the Ministry of Education, Government of India to collect and collate data about higher education institutions, their infrastructure, and the enrollment of students in India. The survey aims to create a database of information about higher education and provide insights for policy making and planning for the development of the sector.

AISHE (All India Survey on Higher Education) is a government survey that collects and provides data and information on various aspects of higher education in India. The survey provides information on various aspects of higher education institutions in the country such as student enrolment, faculty, infrastructure, finances, and more. Based on this information, one can compare and analyze the data to identify the best higher education institutions in India. The data provided by AISHE can help in making informed decisions about choosing the right institute for higher education. The All India Survey on Higher Education (AISHE) is a comprehensive survey conducted by the Ministry of Education in India to gather data on various aspects of higher education in the country.

Here's how AISHE works:

- Collection of data: Data is collected from various higher education institutes across India through an online reporting system. The data collected covers various aspects of higher education, such as student enrollment, faculty information, infrastructure, programs offered, and more.
- Compilation of data: The collected data is compiled and analyzed to generate reports and statistics on higher education in India.
- Publication of reports: The results of the survey are published annually on the AISHE website (https://aishe.gov.in/), providing valuable information and insights on the state of higher education in India.
- Use of data: The data collected by AISHE is used by various stakeholders, including policy-makers, researchers, educators, and students, to make informed decisions about higher education in India. The data is also used to identify areas for improvement and track the progress of higher education in the country.

Overall, AISHE provides a comprehensive picture of higher education in India, enabling informed decisions and action to improve the quality and accessibility of education in the country.

II.OVERVIEW OF THE AL-BASED TOOL

AISHE (All India Survey on Higher Education) is an annual survey conducted by the Ministry of Education, Government of India, to collect data on various aspects of higher education in India. To find the best institutes from AISHE data, you can use various data analysis and visualization tools such as R, Python, Excel, Tableau, Power BI, etc. to analyze the data and identify institutes with high rankings based on various criteria such as student-teacher ratio, research output, infrastructure, etc. It is important to note that the AISHE data is only one of many sources of information that can be used to evaluate institutes, and a comprehensive evaluation of institutes should consider multiple sources of information

III.LITERATURE REVIEW

The Ministry of Education, Government of India, conducts a thorough and ongoing survey known as the All India Survey on Higher Education (AISHE). Data on enrolment, teacher-student ratios, finance, and infrastructure and amenities in higher education institutions, among other topics, will be gathered. All higher education facilities in India are included in the study, including universities, colleges, and autonomous institutions that offer degree, diploma, and certificate programmes. The information gathered through AISHE is used to track and assess the development of India's higher education industry and to guide sector-specific policy decisions. The Ministry of Education's website offers AISHE statistics, which is updated each year to reflect the most recent advancements in India's higher education market. Researchers, decision-makers, and other stakeholders in the higher education sector

frequently utilize the data to inform their work in the field and acquire insights about the state of higher education in India today.

The main objectives of the survey was to

- Identify & capture all the institutions of higher learning in the country
- Collect the data from all the higher education institutions on various aspects of higher education

Data is being collected on following broad items

- Institution's Basic Details
- Teacher's Details

It is possible to use Artificial Intelligence (AI) to predict good higher education institutes based on data collected through the All India Survey on Higher Education (AISHE). This can be done by building machine learning models that take the AISHE data as input and generate predictions of which institutions are likely to be considered "good."

To build such models, the AISHE data would need to be pre-processed and cleaned to remove any errors or inconsistencies. Then, a set of relevant features would need to be selected from the data, such as enrollment numbers, teacher-student ratios, funding, and infrastructure and facilities. These features would then be used as input to train the machine learning models.

Once the models have been trained, they can be used to generate predictions of which institutions are likely to be considered "good," based on the AISHE data. These predictions could then be validated using additional data sources and compared against the actual outcomes to evaluate their accuracy.

It is important to note that the quality of the predictions generated by AI models will depend on the quality of the data used to train the models, as well as the choice of features and algorithms used. It is also important to ensure that the AI models used are transparent, reliable, and unbiased, to ensure that the predictions generated are trustworthy and accurate.

IV. FUTURE SCOPE:

The future scope of AI-based tools to get information about good institutes based on AISHE (All India Survey on Higher Education) data is promising. These tools can analyze vast amounts of data, identify patterns and relationships, and provide insights that can help decision-makers make informed decisions. With the increasing availability of data and advancements in AI technology, such tools can become even more sophisticated and provide more accurate and actionable recommendations.

For example, these tools can be used to identify the top institutes based on various criteria such as academic performance, research output, infrastructure, faculty, and student satisfaction. Additionally, AI-based tools can also be used to monitor the progress and performance of institutes over time and provide early warning signals for any issues that may arise.

In conclusion, AI-based tools have the potential to revolutionize the way information about institutes is collected, analyzed, and used, making it easier for students, researchers, policymakers, and others to access the information they need to make informed decisions.

V. FUTURE SCOPE:

The future scope of AI-based tools to get information about good institutes based on AISHE (All India Survey on Higher Education) data is promising. These tools can analyze vast amounts of data, identify patterns and relationships, and provide insights that can help decision-makers make informed decisions. With the increasing availability of data and advancements in AI technology, such tools can become even more sophisticated and provide more accurate and actionable recommendations.

For example, these tools can be used to identify the top institutes based on various criteria such as academic performance, research output, infrastructure, faculty, and student satisfaction. Additionally, AI-based tools can also be used to monitor the progress and performance of institutes over time and provide early warning signals for any issues that may arise.

In conclusion, AI-based tools have the potential to revolutionize the way information about institutes is collected, analyzed, and used, making it easier for students, researchers, policymakers, and others to access the information they need to make informed decisions.

VI. EXPECTED OUTCOME

An analysis of AISHE data can provide valuable insights and outcomes for higher education in India, including:

1. Benchmarking: AISHE data can be used to compare institutions and benchmark their performance against others. This can help institutions identify areas for improvement and guide their strategic planning.
2. Monitoring progress: AISHE data can be used to monitor trends and changes in higher education in India over time, such as the growth in student enrollment, changes in program offerings, and the development of infrastructure.
3. Evidence-based policy-making: AISHE data can be used to inform policy-making and decision-making at the national and state levels, by providing data-driven insights into the state of higher education in India.
4. Identifying disparities: AISHE data can be used to identify disparities in access to higher education and to assess the impact of policies and initiatives aimed at improving equity and inclusion.

Improving quality: AISHE data can be used to identify areas for improvement in higher education institutions, such as student-teacher ratios, research output, and infrastructure, and to develop strategies for enhancing the

quality of higher education in India.

5. Overall, an analysis of AISHE data can provide valuable insights into the state of higher education in India and help to inform policy-making, improve the quality of higher education, and ensure equitable access to education for all students.

VII. CONCLUSION

In conclusion, AI-based tools have the potential to significantly impact higher education analysis by providing new insights, automating processes, and improving outcomes. The use of AI in higher education analysis is a rapidly growing field, and researchers and practitioners are exploring a wide range of applications, from predictive analytics to campus safety, from student success to admissions and enrollment, and from teaching and learning to administration.

However, it is important to note that the use of AI in higher education also raises several important ethical, legal, and social questions, such as data privacy, algorithmic bias, and accountability. Therefore, it is essential for higher education institutions to carefully consider the benefits and risks of using AI in their operations and to adopt responsible and ethical AI practices that align with their mission and values.

Overall, AI has the potential to revolutionize higher education analysis, but it must be used responsibly and with a commitment to the public good.

Analysing the Impact of Generative AI

Kunal Agrawal, Deexith Madas, Aman Tiwari, Ganesh Utla

Abstract—**Generative AI is a rapidly developing field within artificial intelligence that involves creating new content based on patterns learned from existing data. Technology has already been applied in various industries and has the potential to change the way we live and work. In this paper, we comprehensively analyzethe impact of generative AI on society, focusing on three key areas: creativity, employment, and ethics. We review the existing literature, present case studies, and provide new insights basedon the latest developments in the field. Our results indicate that while generative AI has the potential to enhance creativity and improve efficiency, it also poses a significant threat to employment and raises important ethical considerations. The paper concludes with a discussion of the need for responsible development and use of this technology and provides recommendations for future research.**

I. INTRODUCTION

Generative AI is a rapidly developing field of artificial intelligence that involves the creation of new content based on patterns learned from existing data. Technology has already been applied in various industries, including art, music, writing, and advertising. It has the potential to change the way we live and work by automating routine tasks, enhancing creativity, and improving efficiency. However, the impact of generative AI on society is not yet well understood, and it is important to consider the potential positive and negative impacts of this technology. In this paper, we focus on three key areas: creativity, employment, and ethics.

II. POSITIVE IMPACTS ON CREATIVITY

Generative AI algorithms can be used to generate new ideas and concepts that might not have been possible for human creators to come up with on their own. This can expand the creative industries and increase the number of unique and innovative works produced. For example, generative AI algorithms have been used to generate new paintings, music, and even poetry comparable in quality to those created by humans. This technology has the potential to revolutionize the creative industries and open up new avenues for expression and exploration.

III. CASE STUDY: GENERATIVE ART

One example of the application of generative AI in the creative industries is generative art. Generative art refers to artthat is created using algorithms and computer programs to generate unique and original works based on certain input parameters. Artists can use these algorithms to create unique and creative works that would be difficult or impossible to produce manually. The algorithms can also be used to generate new variations of existing works, which can provide new insights and perspectives for the artists. There are already several artists who are using generative AI algorithms to create works of art that have been well-received by the art world.

IV. IMPACT ON EMPLOYMENT

While generative AI has the potential to automate many routine and repetitive tasks in various industries, freeing up time for human workers to focus on more complex and creative tasks, it also poses a significant threat to employment.The use of generative AI in certain industries could result in job losses, particularly for those whose jobs involve routine or repetitive tasks. This could lead to a widening income gap andsocial unrest, and it is important to consider the potential implications of this technology on employment and the labor market.

V. CASE STUDY: AUTOMATION IN THE MANUFACTURING INDUSTRY

One example of the impact of generative AI on employmentis in the manufacturing industry. The use of generative AI algorithms to automate routine and repetitive tasks in this industry has the potential to increase efficiency and reduce costs. However, it could also result in job losses for workers who are replaced by machines. There is already evidence of this happening in certain industries, such as the automotive industry, where robots are being used to assemble cars, resulting in job losses for human workers. This highlights the need for careful consideration of the impact of generative AI on employment

VI. CASE STUDY: MUSIC INDUSTRY

A recent model by Google, called MusicLM can generate music with just text prompts. The music generated is the best in terms of quality and adherence to the text prompt. This opens a whole new world for music as new music can be generated quickly at a minimal cost. It could also open new territories and styles in music.

There is also the concern about the quality of music that is being generated, along with concerns with respect to copyrights on data used to train models and strict checks whether the music contains no copyrighted material. Like others, job loss is also a big threat to musicians

II. CONCLUSION

Generative AI has the potential to bring about significant positive and negative impacts on society. While it has the potential to enhance creativity and improve efficiency, it also poses a threat to employment and raises important ethical considerations. As such, it is essential that we carefully consider the implications of this technology and ensure that it is developed and used in a responsible and ethical manner. This requires a comprehensive understanding of the impact of generative AI on society, and further research is needed to fully understand the potential implications of this technology.

Areas of Impact	Description
Creativity	Generative AI has the potential to enhance and augment human creativity, enabling the creation of newforms of art, music, and other forms of expression.
Employment	Generative AI has the potential to both disrupt andcreate employment opportunities. Automated systems may displace workers in certain industries, while new jobs may be created in areas related to the development and deployment of generative AI.
Ethics and Responsibility	Generative AI raises a number of ethical considerations, including data privacy, algorithmic bias, and accountability. It is Understanding the full impact of generative AI requires interdisciplinary collaboration between experts in fields such as computer science, psychology, philosophy, and ethics.
Long-term Impacts	The long-term impacts of generative AI are not yet fully understood, and ongoing research is needed to assess these impacts overtime.

AI Attendance System

Kanika Pasi, Sikandar Nishad, Sahil Singh

Abstract - **In this digital era, face recognition system plays a vital role in almost every sector. Face recognition isone of the mostly used biometrics. It can used for security, authentication, identification, and has got many more advantages. Despite of having low accuracy when comparedto iris recognition and fingerprint recognition, it is being widely used due to its contactless and non-invasive process. Furthermore, face recognition system can also be used for attendance marking in schools, colleges, offices, etc. This system aims to build a class attendance system which uses the concept of face recognition as existing manual attendance system is time consuming and cumbersome to maintain. And there may be chances of proxy attendance. Thus, the need for this system increases. This system consists of four phases-database creation, face detection, face recognition, attendance updation. Database is created by the images of the students in class. Face detection and recognition is performed using Haar-Cascade classifier and Local Binary Pattern Histogram algorithm respectively.Faces are detected and recognized from live streaming video of the classroom. Attendance will be mailed to the respective faculty at the end of the session.**

Keywords—Face Recognition; Face Detection; Haar-Cascade classifier; Local Binary Pattern Histogram; attendance system.

I. INTRODUCTION

Traditional method of attendance marking is a tedious task in many schools and colleges. It is also an extra burden to the faculties who should mark attendance by manually calling the names of students which might take about 5 minutes of entire session. This is time consuming. There are some chances of proxy attendance. Therefore, many institutes started deploying many other techniques for recording attendance like use of Radio Frequency Identification (RFID) [3], iris recognition [4],fingerprint recognition, and so on. However, these systems are queue based which might consume more time and are intrusive in nature. Face recognition has set an important biometric feature, which can be easily acquirable and is non-intrusive. Face recognition-based systems are relatively oblivious to various facial expression. Face recognition system consists of two categories: verification and face identification. Face verification is an 1:1 matching process, it compares face image against the template face images and whereas is an 1:N problems that compares a query face images [1]. The purpose of this system is to build a attendance system which is based on face recognition techniques. Here face of an individual will be considered for marking attendance. Nowadays, face recognitionis gaining more popularity and has been widely used. In this paper, we proposed a system which detects the faces of studentsfrom live streaming video of classroom and attendance will be marked if the detected face is found in the database. This new system will consume less time than compared to traditional methods.

II. LITERATURE SURVEY

Authors in [3] proposed a model of an automated attendance system. The model focuses on how face recognition incorporated with Radio Frequency Identification (RFID) detect the authorized students and counts as they get in and get out form the classroom. The system keeps the authentic recordof every registered student. The system also keeps the data of every student registered for a particular course in the attendance log and provides necessary information according to the need. In this paper [4], authors have designed and implemented an attendance system which uses iris biometrics. Initially, theattendees were asked to register their details along with their unique iris template. At the time of attendance, the system automatically took class attendance by capturing the eye imageof each attendee, recognizing their iris, and searching for a match in the created database. The prototype was web based In[5], authors proposed an attendance system based on facial recognition. The algorithms like Viola-Jones and Histogram ofOriented Gradients (HOG) features along with Support Vector Machine (SVM) classifier were used to implement the system. Various real time scenarios such as scaling, illumination, occlusions, and pose was considered by the authors. Quantitative analysis was done on the basis of Peak Signal to Noise Ratio (PSNR) values and was implemented in MATLAB GUI. Authors in [6] researches to get best facial recognition algorithm (Eigenface and Fisherface) provided by the Open CV 2.4.8 by comparing the Receiver Operating Characteristics(ROC) curve and then implemented it in the attendance system. Based on the experiments carried out in this paper, the ROC curve proved that, Eigenface achieves better result than Fisherface. System implemented using Eigenface algorithmachieved an accuracy rate of 70% to 90%. In [7], authors proposed a method for student attendance system in classroomusing face recognition technique by combining Discrete Wavelet Transforms (DWT) and Discrete Cosine Transform (DCT). These algorithms were used to extract the features of student's face followed by applying Radial Basis Function(RBF) for classifying the facial objects. This system achieved an accuracy rate of 82%.

III. PROPOSED SYSTEM

All the students of the class must register themselves by entering the required details and then their images will be captured and stored in the dataset. During each session, faces will be detected from live streaming video of classroom. The faces detected will be compared with images present in the dataset. If match

found, attendance will be marked for the respective student. At the end of each session, list of absenteeswill be mailed to the respective faculty handling the session. The system architecture of the proposed system is given below,

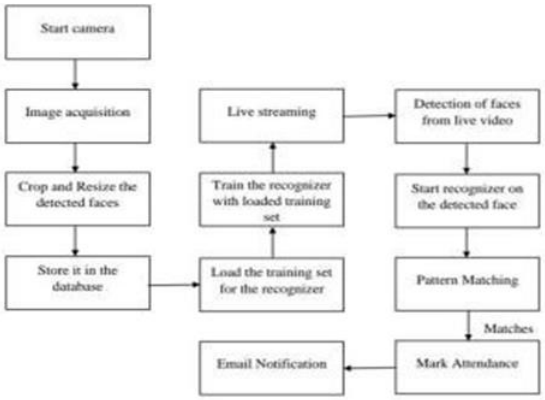

Fig.1. System Architecture

Typically, this process can be divided into four stages:

1. Dataset Creation

Images of students are captured using a web cam. Multiple images of single student will be acquired with varied gestures and angles. These images undergo pre-processing. The images are cropped to obtain the Region of Interest (ROI) which will be further used in recognition process. Next step is to resize thecropped images to particular pixel position. Then these images will be converted from RGB to gray scale images. And then these images will be saved as the names of respective student in a folder.

2. Face Detection

Face detection here is performed using Haar-Cascade Classifierwith OpenCV. Haar Cascade algorithm needs to be trained to detect human faces before it can be used for face detection. Thisis called feature extraction. The haar cascade training data used is an xml filehaarcascade_frontalface_default. The haar features shown in Fig.2. will be used for feature extraction.

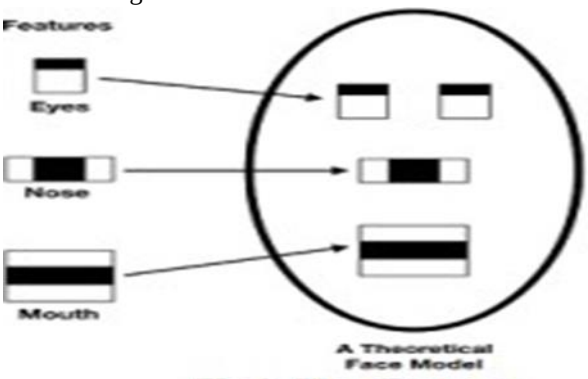

Fig.2. Haar Features

Here we are using detectMultiScale module from OpenCV. This is required to create a rectangle around the faces in an image. It has got three parameters to consider- scaleFactor, minNeighbors, minSize. scaleFactor is used to indicate how much an image must be reduced in each image scale. minNeighbors specifies how many neighbors each candidate rectangle must have. Higher values usually detects less faces but detects high quality in image. minSize specifies the minimum object size. By default it is (30,30) [8]. The parameters used in this system is scaleFactor and minNeighborswith the values 1.3 and 5 respectively.

3. Face Recognition

Face recognition process can be divided into three stepsprepare training data, train face recognizer, prediction. Here training data will be the images present in the dataset. They will be assigned with a integer label of the student it belongs to. Theseimages are then used for face recognition. Face recognizer used in thissystem is Local Binary Pattern Histogram. Initially, the list of local binary patterns (LBP) of entire face is obtained. These LBPs are converted into decimal number and then histograms of all those decimal values are made. At the end, one histogramwill be formed for each images in the training data. Later, during recognition process histogram of the face to be recognized is calculated and then compared with the already computed histograms and returns the best matched label associated with the student it belongs to [9].

4. Attendance Updation

After face recognition process, the recognized faces will be marked as present in the excel sheet and the rest will be markedas absent and the list of absentees will be mailed to the respective faculties. Faculties will be updated with monthly attendance sheet at the end of every month.

IV. RESULTS AND DISCUSSIONS

The users can interact with the system using a GUI. Here users will be mainly provided with three different options such as, student registration, faculty registration, and mark attendance. The students are supposed to enter all the required details in the student registration form. After clicking on register button, the web cam starts automatically and window as shown in Fig.3. pops up and starts detecting the faces in the frame. Then it automatically starts clicking photos until 60 samples are collected or CRTL+Q is pressed. These images then will be pre-processed and stored in training images folder.The faculties are supposed to register with the respective course codes along with their email-id in the faculty

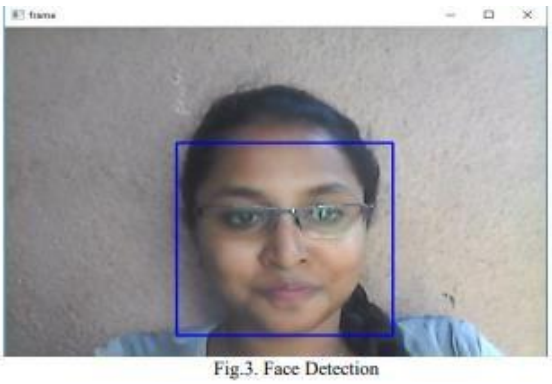

Fig.3. Face Detection

registration formprovided. This is important because the list of absentees will be ultimately mailed to the respective faculties.

In every session, respective faculty must enter their course code. Then after submitting the course code, the camera will start automatically. The Fig.4. shows the face recognition window where two registered students are recognized and if incase they were not registered it would have shown 'unknown'.By pressing CTRL+Q, the window will be closed and attendance will be updated in the excel sheet and names of absentees will be mailed to the respective faculty.

Fig.5. Attendance sheet

The Fig.5. shows the attendance sheet updated after recognition process. Recognized students are marked as '1' andabsent students are marked as '0'. The list of absentees will bemailed to the respective faculty email-id.

V. CONCLUSION

This system aims to build an effective class attendance system using face recognition techniques. The proposed system will be able to mark the attendance via face Id. It will detect faces via webcam and then recognize the faces. After recognition, it will mark the attendance of the recognized student and update the attendance record.

Emerging Technology in E-commerce

Lavkush Yadav, Khushi Chitaliya, Sanjana Kotian
Thakur College Of Engineering & Technology, Mumbai, India
Lavkushy145@gmail.com, Sanjanakotian9434@gmail.com, chitaliyakhushi@gmail.com

Abstract-**Growth of Indian artisans in the e-commerce market with SDG (Sustainable Development Goals).Influenced by both external and internal factors, to gain success, anonline platform captures the attention of buyers, analyzing their behavior through data processing algorithms in order to obtain business information needed for the company's business strategy. With Big Data and Data Mining, the profile of any consumer isprojected directly into the platform,thus communicating the necessary information to predict the behavior in future platform visits. Application use cases of technology used in e- commerce.**

I. INTRODUCTION

India is a culture of heritage and ethnically diverse nations in the world. India is an entrepreneurial country, it is a country of innovation, business, and companies that have gone through a plethora of changes,particularly in the last 10 decades. In this paper, we mainly focused on E-commerce business. India's upwarddevelopment curve jumpstarted the e-commerce business, encouraged entrepreneurship and innovation, created global business leaders, and institutionalized the "jugaad"phenomenon, a unique Indian characteristic that motivated Indians to struggle and prosper, with SustainableDevelopment Goals. According to the United Nation Development Program.

II. LITERATURE REVIEW

India has a startupecosystem and now become 3rd largestin the world accepting the 42technologies in the e-commerce business as artisans led up startups joined the unicorn club in 2022 alone. 1979-Michael Aldrich (UK) 1980-Bussiness-to-Business onlineBusiness purchased started in the UK,Ireland, and Sprain. 1982-Technology grows and the first E-commerce platform mainly based on electronics is made by Boston Computer Exchange.

1995: E-commerce business gone to heights and Amazon had launched by Jeff Bezos1998: PayPal launched the first eCommerce payment system as a tool to make money transfers.From 2005 to 2009 many technologies come into the picture like Amazon prime membership, google launching an online wallet payment app, and Instagram and Facebook launching sponsored stories advertisements which help small e-commerce business to reach every corner of the world. In the 21st century Metaverse, Blockchain technology comes into the picture for secure online payments and proper user Interaction.

III. METHODOLOGY

HTML which is Hypertext Markup Language, CSS which is Cascading Style Sheets, and JavaScript are three separate languages that work together to create web pages and web applications. HTML creates structure, CSS styles the markup, and JavaScript creates interactivity. After using all three languages we will be able to create a basic web page with styling it all the way up to creating interaction with JavaScript.

1.Web scraping: Web or data mining is the act of gathering vast volumes of information from the Internet and storing it in databases for later analysis and usage. Web scraping provides information on price, market dynamics, current trends, competitor activities, and confront issues. If you understand how to get it, this information is readily available. The fact is several marketers are unaware of the benefits of web scraping.

2.Chatbots and Intelligent virtual assistants: Chatbots are an effective tool for engaging with customers and reducing engagement costs. Sales chatbots can carry out the same functions on websites, mobile applications, and messaging services like WhatsApp.

3.E-Wallets: An "e-wallet," a kind of electronic card, is connected to a person's bank account. It is utilized for online purchases on a computer or a smartphone. The two major components of an e-wallet are software and data. The software component secures and encrypts personal information. The information component is a database that contains information that users have

supplied, such as names, shipping addresses, preferred payment options, required payment amounts, credit or debit card information, etc.

4.Supply chain visibility software The entire supply chain, from delivery to warehouses, may be managed using supply chain visibility tools. These systems automate the issuance of invoices and track inventory. While automating supply chain operations, Supply chain visibility software also helps to produce reports that can aid decision-making. They generate financial reports and some can calculate corporate and product carbon footprints. As a result, you may identify your present carbon emissions pain points and take steps to strengthen your environmental, social, and governance (ESG) posture. By doing so, you can increase your sales. For instance, a PwC survey revealed that more than 75% of consumers think about firms' ESG policies before making purchases.

5.Recommendation systems: An artificial intelligence or AI algorithm, usually associated with machine learning, uses Big Data to suggest or recommend additional products to consumers.

IV. APPLICATION:

In this paper, we could use Full stack for development like HTML, CSS, JavaScript, MongoDB, Express, AngularJS, ReactJS, Python, and Blockchain.

For Frontend We could use HTML and CSS, HTML For structuring my web application, and CSS for the decoration of their web application.And Then Use MERN Stack to create a faster website. MERN Stack is to develop applications using JavaScript, regarding this we could use JavaScript also.And after all this, We could use Python in Backend for Visualization, Validation, interaction with users, and regarding many more things like NLP (Natural Language Processing) as we know that Chatbot is a very useful technology in our Digital market system. Using NLP, We Could create a Chatbot System for Interaction between users and admin.At the last, We could use a payment system which is very important forboth users and admin also so we coulduse Python and Blockchain systems, python for applications, and blockchain for security systems. In payment Gateway, we could use all type of payment services like mobile recharge, light bill recharge, shoppingpayment, bank transfer, and many more which is used in their technology systems. Note: For connectivity of frontend and backend we use Django (python framework).

V. ACKNOWLEDGMENT

I am humbled to Acknowledge the priceless guidance offered by Artificial Intelligence & Data Science Department teachers from Thakur College Of Engineering& Technology for this research paper

Review Paper on Machine Babies - Future Mothers Could Be Machines

Lavanya Bhat, Shivam Dubey, Joel Thomas
TCET

Abstract—**Consider for a moment that you haven't even been born. You have the option of entering either the male or female realms, but you are unsure of how you will emerge out. One biological sex bears the dangers of falling unwell or dying during childbirth in Society A, which is the first option that is presented to you. Alternately, you can choose Society B, where every embryo grows securely in a lab. Do you have a plan? That is the issue we want to answer in this study paper on a subject called "Ectogenesis," which is a catch-all word for a technology that enables the artificial growth of children outside the womb. Asking the right questions is imperative given that 300,000 moms tragically lose their lives each year while giving birth. Is it really worth risking a mother's life to have a child, or do we as a society have to accept the unlikely but real possibility of ectogenesis, surrendering our caveman morals for the benefit of mankind?**

Keywords: Artificial womb, Ectogenesis, Artificial gestation, foetal viability

Impact Statement—A business called EctoLife is attempting to bring the fictional notion of Ectogenesis to life. Your infant can grow up in a germ-free environment thanks to EctoLife. The materials used to make the pods prevent bacteria from adhering to their surfaces. Each growth pod has sensors that can track your baby's vital signs, including heartbeat, temperature, blood pressure, breathing rate, and oxygen saturation. The artificial intelligence-based technology also keeps track of your baby's physical characteristics and alerts you to any potential genetic anomalies. If used internationally, this cutting-edge technology will almost eliminate all maternal and newborn mortality.

I. INTRODUCTION

Ectogenesis research, often known as artificial womb technology, is a quickly expanding field of study with the aim of creating a device that can maintain a fetus's growth and development outside of the human uterus. Premature infants, who are at a significant risk for long-term health issues and death, could benefit greatly from this technology. For decades, books and movies have been inspired by the concept of developing infants outside the body. Today, research teams from all across the world are looking into the potential of artificial gestation. For instance, one team was successful in raising a lamb for four weeks in a synthetic womb. Additionally, Australian researchers have tried with shark and lamb artificial gestation. An estimated 15 million babies are born prematurely each year, before 37 weeks of gestation; one million die from complications and contribute significantly to childhood morbidity, both of which are related to this condition; unfortunately, this data is expected to rise. The main focus of the debate concerning artificial wombs has been on its ability to improve the survival rate of very preterm infants. This may sound far-fetched, but many scientists working in reproductive biotechnology believe that full ectogenesis is a real possibility with the right scientific and legal support. The primary focus of the debate surrounding artificial wombs has been on their potential benefit in increasing the survival rate of extremely premature babies. This emerging reproductive technology may provide women who are infertile for physiological or social reasons with the opportunity to have a child. It may also allow transgender women and other women who were born without a uterus, or who lost their uterus due to cancer, injury, or medical conditions, to have children. An artificial womb may provide an optimal environment for the foetus to grow by supplying the proper balance of hormones and nutrients. It would also protect the developing foetus from external threats such as infectious diseases.

II. RELATED WORK

JBS Haldane coined the term "ectogenesis" to describe the usage of artificial wombs in 1923. In 2016, researchers published two papers on the thirteen- day development of human embryos in ectouteri. Currently, a 14-day restriction prohibits keeping human embryos in lab wombs for more than 14 days. In twelve nations, this norm has been enshrined in legislation. A study that showed premature lamb foetuses had been grown for four weeks on an extra-uterine life support system was released in 2017 by foetal researchers at the Children's Hospital of Philadelphia. The first artificial womb facility in the world is being created by a biotechnologist in Germany, and it will let parents to select the traits of their child from a menu. According to reports, EctoLife, which can produce 30,000 children annually, is the result of more than 50 years of innovative scientific study. Hashem Al-Ghaili, a resident of Berlin, is the creator of the idea. According to him, the facilities will enable infertile couples to become the real biological parents of their own children by helping them conceive a child.You may genetically modify the embryo before placing it in the artificial womb if you purchased a "Elite Package." You can choose your strength, height, IQ, and eye and hair colour in addition to avoiding inherited genetic illnesses. Around 300,000 women perish from pregnancy-related problems, according to the World Health Organization. Human suffering can be lessened by using the EctoLife artificial womb, which also lowers the likelihood of C-sections. Premature births and C- sections will no longer occur thanks to EctoLife. According to Hashem, it also provides a solution for women whose

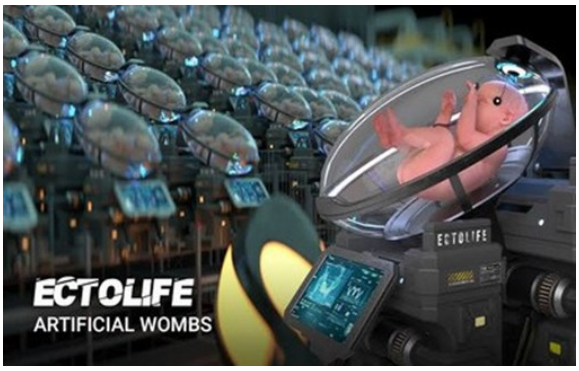
uteri were surgically removed owing to difficulties from cancer or other diseases. As well as Japan, Bulgaria, South Korea, and many other nations that are experiencing a significant population drop, it may also be beneficial. He thinks that since the technology is currently in place, the only thing stopping the idea from becoming reality are ethical considerations. The building has 75 extremely well- equipped labs that can each hold up to 400 growth pods or artificial wombs. Each pod is built to precisely imitate the conditions that exist inside the mother's uterus. Up to 30,000 lab-grown infants can be incubated in one building each year. The pods have a screen that shows real- time information about the infant's development. phone app can be used to view the data as well. The artificial intelligence-based technology also keeps track of your baby's physical characteristics and alerts you to any potential genetic anomalies. EctoLife growth pods include inside speakers that play a variety of phrases and music to your baby because it is believed that newborns can understand language and absorb words while still in the womb.

A baby can choose the music they listen to on an app, and you can sing to them directly to help them get used to your voice before delivery.By using an artificial umbilicalconnection to transport the babies, the second bioreactor is made to get rid of any waste materials they make.The second bioreactor may then recycle waste products and transform them back into valuable nutrition thanks to a delicate layer of designed enzymes. The facility will then make sure that your kid receives a consistent and long- lasting supply of fresh nutrition.

III. lll. NEGATIVE IMPACTS

1. Artificial wombs might be harmful to women, increase inequality, and result in prejudice. A welcome option to aborting a pregnancy may appear for some women in employing an artificial womb to maintain gestation. There are worries, though, that other women considering abortionswould be forced to use an artificial womb to keep the pregnancy going.
2. A significant widening of the wealth disparity may result from artificial wombs. Rich potential parents may decide to invest in artificial wombs, whereas less fortunate individualswill use the bodies of women to carry their children during the gestation period.
3. The possibility of prejudice against people born in an artificial womb is another issue.

How can we make sure that people's origin stories are not the target of unfavourable public curiosity or mockery, or that neither prejudice nor intrusive publicising occur?



IV. CONCLUSION

The new technology of artificial wombs will be tremendously potent. Depending on who is requesting, producing, controlling, and paying for the technology, that power will present itself in different ways.While this technology may solve some existing problems concerning inequality in reproduction, there are many other issues that demand our immediate attention. In this generation of revolutionary breakthroughs in the field of healthcare and lifestyle, EctoLife is poised to unequivocally become the pioneers of an artificial womb. A concept which was as radical as flying cars, time travel and teleportation is being brought to fruition as you read through this article. If human hatcheries could be breathed in existence, what else does Artificial Intelligence and technology in general have instore for us? Overall, research on artificial womb technology is still in the early stages, and significant technical and ethical hurdles must be overcome before this technology can become a reality. However, the potential benefits for premature infantsand their families make it an area of study worth pursuing. While artificial wombs won't be available for several decades, full ectogenesis will. When they do, we need to make sure that they do so in a culture that values women for more than simply their ability to procreate and that they are employed to help others who are unable to become pregnant for medical, not societal, reasons. There is time left. But perhaps not enough as the rush to innovate continues.

A Review on Augmented Reality and Virtual Reality in Education

Om Kokate, Mitali Mandge Viraj Zaveri

Thakur college of engineering & technology Mumbai, India

Abstract- **Virtual reality and augmented reality have been included in a variety of educational initiatives, including those in the domains of astronomy, architecture, physics, geology, biology, chemistry, mathematics, geometry, the humanities, training, and many other areas. The measurement of AR's contribution to the learning process and the feasibility of integrating virtual reality into the learning environment were both subjected to a systematic investigation. Virtual reality (VR) provides fresh methods for visualizing information and alternative methods for presenting educational resources. Whether VR and/or AR will assist solve the current issues in education is a topic of discussion. These innovations will usher in a new era of education and link conventional learning to cutting-edge technology.**

Key Words: Teaching-Learning Process, Students, Augmented Reality, Virtual Reality, and Visualization.

I. INTRODUCTION

In recent years, technology has had a profound impact on a wide range of aspects of life. Our thought patterns, societal norms, behaviors, and manner of life have all changed significantly from just a few years ago. The value of augmented reality as a new technology has grown significantly. In order to enhance learning processes, this study investigates virtual reality (VR) and augmented reality (AR) technology. In order to improve the experience, functionality, and effectiveness of learning, new VR and AR technology and cell phones can be combined with a number of other important factors, such as cutting-edge virtual courses, responsive teachers and rules, effective instructional resources, funding for hardware and apps, competent and confident instructors, and prepared learners. Such innovations have the considerable benefit of fostering a learning-centered environment in the classroom, which is a significant benefit from the perspective of instruction. This encourages the adoption of creative instructional strategies and adds fresh methods of education into the education process. The new ICT technology is being adopted by students with great enthusiasm. Technical advancements have made it possible to use revolutionary VR learning environments for institutions of higher learning, businesses, and creative endeavors. Since ICT is now a significant component of students' societies, these new innovations are anxious to be seen by them. Even though there has been extensive research on AR, it has emerged that just a few trials have been carried out in this area. However, due to the good aspects and results of advancements in computer and information technology, augmented reality in education is believed to have an effective role with greater consumer penetration than ever before.

II. LITERATURE REVIEW

As long as we stick to the status quo, there is no room for improving the ideas being taught. Numerous studies demonstrate the benefits of augmented reality and virtual reality in education, including the ability to visualize abstract items, improve conceptual understanding, and discover new learning approaches while also igniting student curiosity. For those who have a particular condition or dyslexic, these strategies can be helpful (who find it arduous to learn from books). With its unique ability to immerse Reality and offer more levels of interaction to enhance the user experience, AR has a distinct advantage. Using real-world scenarios, virtual reality (VR) aids in the simplification of difficult problems and enables the student to virtually explore new environments. A study of prospective teachers' opinions, expectations, and goals with regard to the usage of developing areas in the classroom is critical since some academics believe that a teacher's morale is crucial to education. Based on a survey the researchers did, which included interviews with a few teachers about their experiences with AR/VR, lab environments, current software for educational purposes in the physics domain, etc., a prototype for a few concepts in the physics domain was created. The Microsoft HoloLens prototype was created. After showing the professors the prototype, a poll was done to find out their thoughts on how AR/VR will aid in the physics field. The survey's findings included a litany of benefits, including the ability to comprehend ideas like gravity, electricity, and magnetism that are imperceptible to unaided sight. Students will learn more effectively if real-world items are enhanced along with the previously described ideas. The major purpose of AR/VR is to give students access to experiments that would be impossible in a real-world setting. The issues raised in "Problem with Time": users who travel through time can experience historical periods; in this case, virtual reality serves as a tool for teaching history to students. Physically inaccessible: When we explore the field of science, we see that there are particular situations that are unaffected by learning from real-world experience. Various criteria related to the unique affordances of AR technology that set it apart from conventional classroom tools were used to determine the suitability of adding it to a subject: A Three-dimensional representation of the mathematical context benefits students. (For instance, volume visualization) Separate representations of the stuff displayed in sync. (For instance, combining geographic and numerical representations)

III. OPPORTUNITIES AND CHALLENGES

Opportunities for AR/VR in the field of education are vast and spread over a lot of applications.

1. Research has shown that augmented reality and virtual

reality developments are extremely beneficial for education and can aid in the successful development of student's abilities and knowledge.

2. AR/VR programs have the potential to improve learning outcomes by enhancing content and boosting student engagement.

3. Students not only appreciate AR/VR learning but also teaching, and AR/VR applications help them understand concepts more completely. For instance, some children are unable to comprehend virtual objects or abstract occurrences like the world's rotation. The use of AR and VR allows students to experience complicated ideas, view 3D models, and digitally alter models.

4. Instantaneous messaging is possible with VR technology. Concurrent participation by students is possible in a virtual classroom. They may converse, receive immediate feedback from others, and experience a sense of community with their classmates.

5. The opportunities listed above have improved the quality of education tremendously and have also increased the interest of students in academic as well as holistic development. Although the technology of AR/VR provides a plethora of opportunities to be used in the educational world, it faces some challenges in the implementation as well.

6. For several VR/AR examples, computers, and display devices are frequently needed, which might be challenging for many schools.

7. The absence of realism in VR or AR simulations is the second barrier to overcome. The quality of the visuals conveys the consumer's delight, enhancing the visual presentation and resulting in a rich experience.

8. The third problem is the pupils' physical and mental state of health. (Head Mounted Displays) Due to their weight, HMDs can eventually make users feel worn out.

9. Studies and research are working towards overcoming these challenges and providing newer, improved facilities to enhance the learning experience of students via technology.

IV. CONCLUSION

New technology is being embraced by both students and preceptors because it helps students recall material and visualize difficult concepts. Ninety-seven percent of students say they would like to take an AR or VR course, while seven out of ten preceptors say they would like to employ VR to simulate real-world scenarios related to the lessons they teach. The fourth-largest sector predicted to make VR investments is education. Numerous studies, such as this one by Statista, predict that by 2025, VR in education will be a $ 700 million industry. The major purpose of this model is to give students a way to simulate exams that would be difficult for them to complete in a real-world environment.

V. FUTURE SCOPE

I. When used in conjunction with the appropriate content, AR/VR techniques for teaching can be very beneficial to educators as well. Edtech startups reminded us that regardless of the platform, content is and always will be king. Without the correct material, VR headsets will do nothing more than collect dust on a shelf, much like textbooks.

II. While VR and AR can provide the ideal virtual simulations and interactions to meet students' requirements, harnessing the power of AI will enable us to develop creative curricula and lesson plans with essentially no human involvement

Applications of 5G Technology: How can it Revolutionize the Industry?

Akash Dubey, Rishabh Jha, Sugam Pandey

Abstract **The fifth generation (5G) cellular network technology is set to revolutionize the way we communicate, work, and live. With its faster speed, lower latency, and increasedcapacity, 5G has the potential to transformvarious industries. This paper explores the applications of 5G technology in healthcare, manufacturing, automation, entertainment, energy, agriculture, and education. By providing real-time monitoring, remote consultations, and telemedicine in healthcare, enabling Industry 4.0 and smart factories in manufacturing, supporting autonomous vehicles and robots in automation, and providing immersive experiences through virtual and augmented reality in entertainment, 5G is poised to bring abouta technological revolution. The benefits of5G technology will be experienced by individuals, businesses, and society.**

I. INTRODUCTION

5G technology, the fifth generation of wireless communication technology, is poised to bring about a technological revolution in various industries. The key advantages of 5G technology include fasterspeeds, lower latency, and increased capacity. These advantages will enable new opportunities for innovation and growth in a wide range of applications.In the healthcare sector, 5G technology will enable real-time monitoring and remote

consultations, making healthcare more accessible and convenient. With the ability to transfer substantial amounts of data in real-time, 5G technology will also facilitate the use of telemedicine, allowing patients to receive medical care from the comfort of their own homes. This will improve patient care and outcomes, particularly in rural or remote areas where access to healthcare is limited.

In the manufacturing sector, 5G technology will support Industry 4.0 and the development of smart factories. By connecting machines, devices, and other assets in real-time, 5G technology will enable the automation of production processes, leading to greater efficiency, productivity, and competitiveness. This will also reduce the need for manual labor and minimize the risk of human error, making the manufacturing process safer and more reliable.

In the entertainment sector, 5G technology will enable the creation of immersive experiences through virtual and augmented reality. With its high speeds and low latency, 5G technology will allow users to experience entertainment content in real-time, without the need for wires or cables. This will open new possibilities for gaming, video streaming, and other forms of digital content.

In the energy sector, 5G technology will enable the creation of smart energy grids that can monitor energy usage in real-time and respond to changes in demand. This will improve energy efficiency and reduce waste, contributing to a more sustainable energy future.

In the agriculture sector, 5G technology will support precision agriculture, enabling farmers to monitor their crops in real-time and respond to changes in weather or soil conditions. This will improve crop yields and reduce waste, contributing to a more sustainable and efficient food system.

In the education sector, 5G technology will enable remote learning and distance education, making education more accessible and convenient. With its high speeds and low latency, 5G technology will also allow students to participate in virtual classroom experiences and access educational content in real-time.

In conclusion, 5G technology has the potential to revolutionize various industries, bringing about a new era of innovation and growth. By providing faster speeds, lower latency, and increased capacity, 5G technology will enable new applications and opportunities for innovation across a wide range of sectors.

II. RELATED WORK

The use of 5G technology in the healthcare sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to improve patient care and outcomes, reduce costs, and increase access to healthcare.

One study conducted by the European Commission found that 5G technology could bring about significant improvements in the field of telemedicine, including remote consultations and real-time monitoring. Another study by the World Health Organization found that 5G technology could support telemedicine, telehealth, and eHealth, reducing the need for patients to travel and improving access to healthcare in rural or remote areas.

The use of 5G technology in the manufacturing sector has also been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support Industry 4.0 and the development of smart factories, leading to greater efficiency, productivity, and competitiveness.

One study conducted by the Fraunhofer Institute found that 5G technology could support real-time communication between machines, devices, and other assets, enabling the automation of production processes and reducing the need for manual labor. Another study by the European Union found that 5G technology could support the development of smart factories, improving the accuracy and efficiency of production processes and reducing the risk of human error.

The use of 5G technology in the entertainment sector has been the subject of several studies and research projects.These studies have explored the potential of 5G technology to create immersive experiences through virtual and augmented reality.

One study conducted by the University of California found that 5G technology could support the development of immersive gaming experiences, providing users with real-time, wire-free gameplay. Another study by the University of Oxford found that 5G technology could enable the creation of virtual and augmented reality content, allowing users to experience entertainment content in new and innovative ways.

The use of 5G technology in the energy sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to create smart energy grids that can monitor energy usage in real-time and respond to changes in demand.

One study conducted by the Massachusetts Institute of Technology found that 5G technology could support the creation of smart energy grids, improving energy efficiency and reducing waste. Another study by the International Energy Agency found that 5G technology could support the development of renewable energy sources, enabling the creation of sustainable and efficient energy systems.

The use of 5G technology in the agriculture sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support precision agriculture, enabling farmers to monitor their crops in real-time and respond to changes in weather or soil conditions. One study conducted by the University of Cambridge found that 5G technology could support precision agriculture, improving crop yields and reducing waste. Another study by the United Nations found that 5G technology could support the development of sustainable food systems, enabling the creation of more efficient and sustainable agricultural practices.

The use of 5G technology in the education sector has been the subject of several studies and research projects. These studies have explored the potential of 5G technology to support remote learning and distance education, making education more accessible and convenient. One study conducted by the University of Edinburgh found that 5G technology could support remote learning, enabling students to participate in virtual classroom experiences and access educational content in real-time.

III. METHODOLOGY

The methodology used to study the applications of 5G technology typically involves the following steps:

Literature Review: Researchers conduct a comprehensive review of existing studies and publications on 5G technology and its applications, to understand the current state of knowledge and identify areas for further research. This includes reviewing technical papers, conference proceedings, and industry reports.

Requirements Analysis: The requirements for each application are analyzed to determine the specific capabilities of 5G technology. This includes considering factors such as bandwidth, latency, and network coverage. Researchers may also consult with industry experts and stakeholders to identify the requirements for each application.

Prototyping: Prototype systems and models are developed to demonstrate the potential of 5G technology for each application. This allows researchers to test and validate the performance of 5G technology in real-world scenarios. The prototypes can be simple or complex, depending on the requirements of the application.

Performance Evaluation: The performance of the prototypes is evaluated, including measurements of key parameters such as data rate, latency, reliability, and energy efficiency. Researchers may use simulations, testing, and monitoring tools to evaluate the performance of the prototypes.

Implementation: Based on the results of the performance evaluation, the best solution is selected and implemented. The implementation process involves developing software and hardware systems and deploying them in real-world environments. This may involve working with industry partners, service providers, and technology vendors to develop and deploy the systems.User Feedback: Feedback is collected from users of the applications to assess their satisfaction and identify any areas for improvement. This includes conducting surveys, focus groups, and user studies to gather user feedback.

Performance Monitoring: The performance of the applications is monitored over time to ensure they continue to meet users' needs. This includes tracking key metrics such as data rate, latency, reliability, and energy efficiency.

Improvement: Based on the results of the performance monitoring, researchers may make improvements to the applications to enhance their performance and usability. This may involve updating software, modifying hardware, or making other changes to improve the applications.

Conclusion: The results of the research are summarized, and conclusions are drawn regarding the capabilities and limitations of 5G technology for each application.Recommendations are made for future research and development.

Dissemination: The results of the research are disseminated to the academic community, industry, and the public. This may include publishing technical papers, presenting research results at conferences, and providing training and education on the applications of 5G technology.

This methodology provides a comprehensive and systematic approach to studying 5G technology applications and ensures the results are robust and reliable. By following these steps, researchers can identify the best solutions for each application, and ensure that 5G technology is being used to its full potential.Experimental results and discussion

Experimental results and discussion of the applications of 5G technology are an essential part of any research in this area. The following are the key steps in conducting

experimental results and discussion:

Data Collection: Data is collected from the prototypes and real-world implementations of 5G technology. This may include data on network performance, user experience, and application usage. The data collected should be representative of the real-world use cases and be collected under controlled and repeatable conditions.

Data Analysis: The collected data is analyzed to determine the performance of 5G technology in each application. This includes evaluating key metrics such as data rate, latency, reliability, and energy efficiency. Researchers may use statistical methods, such as regression analysis, to evaluate the performance of 5G technology.

Comparison with Existing Systems: The performance of 5G technology is compared with that of existing systems and technologies, such as 4G and Wi-Fi. This comparison provides valuable insight into the strengths and limitations of 5G technology for each application.

Identification of Trends: Based on the data analysis, researchers may identify trends and patterns in the performance of 5G technology. This includes identifying factors that influence the performance of G technology, such as network conditions and user behavior.

Discussion of Results: The results of the data analysis are discussed in detail, including a thorough explanation of the findings and their implications. This includes highlighting the strengths and limitations of 5G technology for each application and providing recommendations for future research and development.

Validation of Results: The results are validated through further experimentation, testing, and analysis. This includes repeating experiments to confirm the results and checking for any inconsistencies. The results may also be verified through peer review.

Comparison with Previous Work: The results are compared with previous work in the area to ensure consistency and to build on existing knowledge. This includes reviewing previous studies and publications on 5G technology and its applications.

Conclusion: A conclusion is drawn based on the results of the experiments and the data analysis. This includes summarizing the key findings and making recommendations for future research and development.

Dissemination: The results are disseminated to the academic community, industry, and the public. This may include publishing technical papers, presenting research results at conferences, andproviding training and education on the applications of 5G technology.

By conducting experimental results and discussion, researchers can gain a better understanding of the capabilities and limitations of 5G technology for each application. This provides valuable information for developing new applications and improving existing ones and helps ensure that 5G technology is being used to its full potential.

IV. CONCLUSION

5G technology has the potential to revolutionize the industry in several ways, with its high data rates, low latency, and increased network capacity serving as the foundation for a range of new and innovative applications. It can have a significant impact on areas such as the Internet of Things, Virtual Reality and Augmented Reality, autonomous vehicles, healthcare, entertainment, and Industry

4.0. The real-time communication and coordination enabled by 5G technology is critical for supporting the development of new applications in these areas and can help to deliver tremendous economic and social benefits. With the right investments in infrastructure and research, 5G technology is poised to play a critical role in shaping the future and providing a foundation for future innovations.

Conversational Search Engine – ChatGPT

Parth Ghag, Chandan Solanki, Shalini Vishwakarma, Dr. Shivani Gupta, Amit Tiwari

Thakur college of engineering & technology Mumbai, India

ghagparth23@gmail.com, chandddann14@gmail.com, shyliniVishwa@gmail.com, shivani.gupta@thakureducation.org, amit.tiwari@thakureducation.org

Abstract--- Conversational artificial intelligence (AI) refers to technology that consumers may converse with, such as chatbots or virtual agents. They use massive amounts of data, machine learning, and natural language processing to mimic human interactions, such as identifying speech and text inputs and interpreting their meanings across several languages. Natural language processing (NLP) and machine learning are combined in conversational AI. Conversational AI contains fundamental components that enable it to process, comprehend, and respond in a natural manner. ChatGPT is an OpenAI- developed big language model chatbot built on GPT-3.5. It has an amazing capacity to interact in the form of a conversational dialogue and offer responses that can appear quite human. Chat GPT, which is driven by OpenAI's powerful GPT-3 language model. In this paper we focus how ChatGPT can cut down the Google market and can revolutionize user's searching experience.

Keywords--- ChatGPT, NLP, Artificial Intelligence, Machine Learning, Conversational AI, Search Engine, generative AI.

I. INTRODUCTION

The broad area of machine learning, which includes generative AI systems, can be used to produce new content such as audio, code, images, text, simulations, and movies.Latest developments in the sector could fundamentally alter how we think about content creation.This fascinating form of machine learning allows computers to generate all sorts of fresh and exciting stuff, from music and art to entire virtual worlds.Additionally, generative AI has many useful applications outside entertainment, including developing new product concepts and streamlining business procedures.

ChatGPT is a long-form question-answering AI from OpenAI that conversely responds to complicated inquiries. It's a ground-breaking technology since it's been taught to understand what people mean when they ask questions. Many users are in awe of its capacity to deliver responses of

human- quality, which gives rise to the idea that it might soon have the ability to revolutionise how people interact with computers and alter how information is retrieved. ChatGPT learns how to obey instructions and provide responses that are acceptable to humans using Reinforcement Learning with Human Feedback (RLHF), an additional training layer.

A. GPT-3

GPT stands for Generative Pre-trained Transformer 3. The autoregressive language model GPT-3, was published in 2020, which employs deep learning to generate text that resembles a text given by a person. It will produce text that follows the prompt when given a beginning text as input. OpenAI made its latest creation ChatGPT chatbot available for free public testing.On November 30, 2022, ChatGPT was introduced as a prototype. It soon gained popularity for its thorough responses and clear responses in a variety of subject areas.

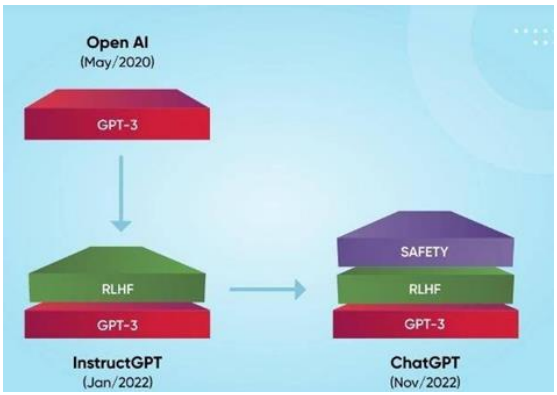

Fig. 1 GPT's Evolution

II. WORKING

- Utilizing RLHF, or Reinforcement Learning from Human Feedback, the model has been trained.
- In comparison to the preceding models, data collection is carried out using a more supervised, fine-tuned approach.
- Trainers for human-assisted AI create discussions in which they take on the roles of both the user and the AI assistant.
- These instructors have sample written recommendations to help them when writing responses.
- Together with the prior InstructGPT data, the new database was converted into a conversation format.
- Information is gathered from interactions that AI trainers had with the chatbot and is compared between two or more model responses, ranked by quality.

- This process is repeated several times, and the model is improved.

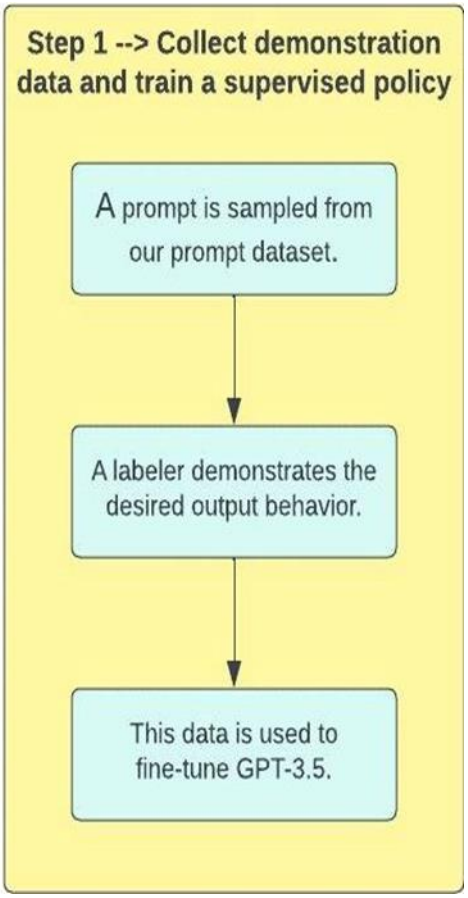

Fig. 2.1 Generative AI's Working

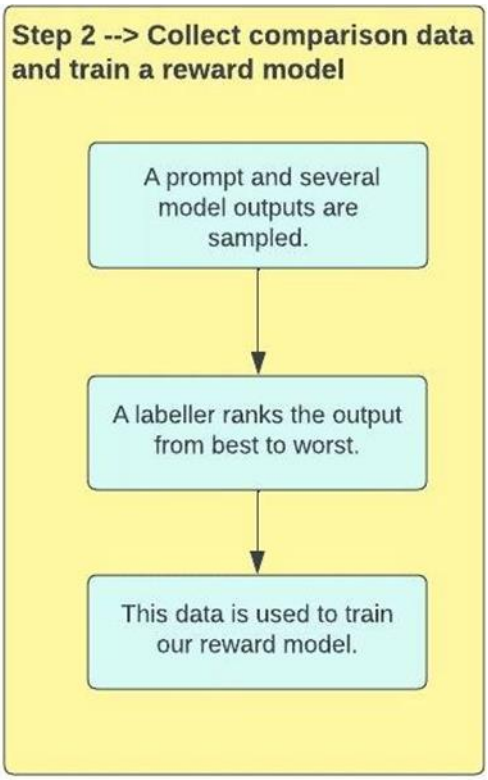

Fig. 2.2 Generative AI's Working

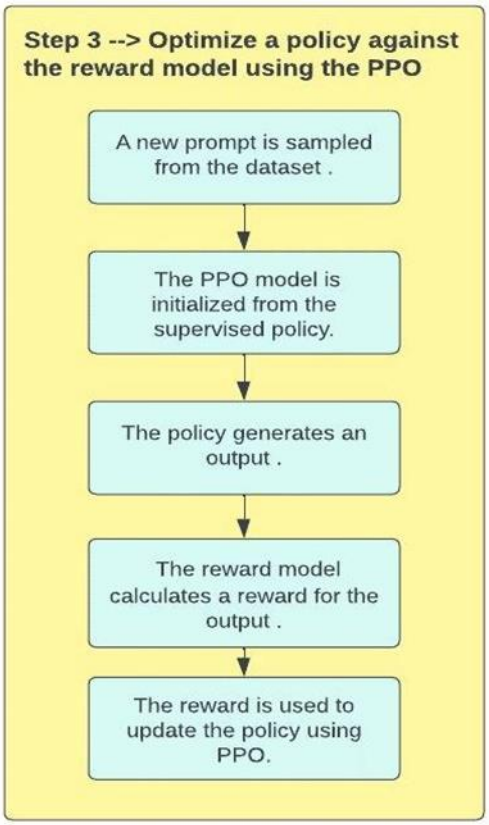

Fig. 2.3 Generative AI's Working

III. USE-CASES

A. Customer Service:

Businesses can offer a more effective and easy customer care experience by utilising ChatGPT to build a chatbot that can comprehend and answer to customer questions and requests naturally and in a conversational manner. Both the company and the client may benefit by saving time and resources in this way.

B. Education or Training purposes:

The individualised learning experience that personalised material and evaluations deliver can benefit both students and employees. These are determined by the user's demands and advancement. This can be especially helpful in fields like healthcare or finance where continuing training is required.

C. Entertainment and leisure:

Chatbots could develop virtual assistants that propose music or movies or offer specialised exercise or meditation regimens. These applications benefit from ChatGPT's capacity to comprehend and react to user input in a natural and conversational manner.

D. Travel:

Chatbots may help with flight, hotel, and vehicle rental reservations as well as make suggestions for places to go and things to do. For users, this might result in a more effective and convenient travel planning procedure

IV. TRADITIONAL SEARCH ENGINES

A Search engine is a group of programs working together to find and identify things in a database that meets certain criteria. Search engines are basically used to access information. A search engine result page (SERP), which ranks the pages that are found in order of their relevance, is returned when a user enters a query into a search engine. It varies depending on the search engine how this ranking is done. To enhance user experience, search engines frequently modify their algorithms (the programs that rank the results). They want to provide users with the finest response possible by comprehending how they search. This entails giving top consideration to the most relevant and high-quality pages.

A. Working of Traditional Search Engines

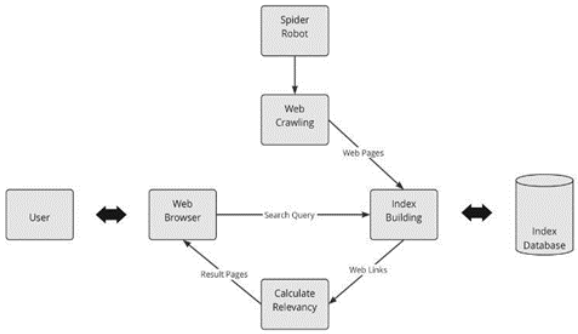

Fig. 3 Working of Search Engines

The Search engines working consist of three important steps :

1. Crawling: The existence of pages on the web is found by crawlers. A search engine is always looking for fresh, updated pages to add to its database of previously found pages. This process is known as URL discovery. The crawler looks over a page's content after finding it. To choose which pages to crawl and how frequently, the search engine utilities an algorithm.

2. Indexing: A page's textual content is processed, examined, and labeled with attributes and metadata after it has been crawled by a search engine to assist it comprehend what the page is about. Additionally, it helps the searchengine to identify duplicate pages and gather content-related signals, such as the nation or region the website is local to and the page's usability.

3. Searching and Ranking: The search engine looks for matching sites in the index when a user types a query, and it then returns the results that seem to be most pertinent on the search engine results page (SERP). The authoritativeness of a page, the quantity of backlinks to the page, and the keywords it includes are some of the characteristics used by the engine to rank content.

V. COLLABORATION OF MICROSOFT AND OPEN AI Microsoft eventually made it official that they were

expanding their collaboration with OpenAI, the company behind the ground-breaking ChatGPT application. Since OpenAI trains all of its models on Azure, Microsoft Azure will still be the only cloud service provider for the tool.

Microsoft did not provide a dollar amount, but it is speculated that the investment will be $10 billion as the tech giant seeks to expedite AI advancements for the benefit of the entire world, according to a release.

When it comes to how the world's largest tech companies compete with one another, artificial intelligence has the potential to revolutionise the game. According to some experts, the AI market will be competitive as businesses look for ways to use machine learning to improve corporate processes.

Fig. 4 Microsoft and Open AI's Collaboration Microsoft officially announced a new multi-year

investment in OpenAI, the startup behind ChatGPT, in a press statement on January 23. Microsoft was reportedly aiming to invest an extra $10 billion in the firm when we last wrote about its investment in ChatGPT, according to Semafor. The official release doesn't confirm or reject the claimed dollar sum, as they just commented on continuing the cooperation.

Microsoft stated their dedication to transforming Azure into a global AI supercomputer. Every tool under the OpenAI brand uses Microsoft Azure as its exclusive cloud provider.

The following statement was made in the announcement by Microsoft CEO Satya Nadella. Developers and businesses from a variety of sectors will have access to the greatest AI infrastructure, models, and toolchain with Azure throughout this next phase of our relationship to create and run their apps.

VI. IMPACT OF CHATGPT ON SEARCH ENGINES The allure of this is the potential influence on

traditional search engines. In comparison to a search engine like Google, ChatGPT may be able to grasp a question and the nuances of the intent behind it much better thanks to AI. The call-and-response style used by ChatGPT allows for more sophisticated follow-ups as well. The user can contest the answer given or ask for more details, and ChatGPT can correct any errors or enhance its response.

The search engine replies to questions or prompts with links, including advertising links which serve to power its revenue.

Nonetheless, it is simple to see how ChatGPT might interfere with this. Instead of encouraging visitors to click on connections to other websites, ChatGPT can just deliver brief replies or clear explanations itself. This might drastically revolutionise the way people engage with search engines — fact, the whole ecology

surrounding the search engine revenue model, and search engine optimisation, could be thrown on its head.

The potential for disruption is so enormous that, according to a New York Times report, senior leaders at Google's parent firm Alphabet have declared a 'code red' to better comprehend the possible impact on Google and the larger search engine sector.

A. ChatGPT's influence:

1. Microsoft Bing: Recent reports have stated that Microsoft, a big investor in OpenAI, aims to launch a version of its Bing search engine employing the AI behind ChatGPT as early as this spring. Quite how this integration will function is not yet obvious – not least because ChatGPT's knowledge base currently stops at the end of 2021 – but its capacity to deliver entire responses in the style of human speech patterns could make the user experience friendlier than that of Google. In the future, inquiries submitted through Bing might be answered in few words rather than a list of links that need additional inquiry (and are positioned according to advertisers' needs), if the technology can be demonstrated to be viable and kept up to date.

2. Google: LaMDA, a smart AI developed by Google that can interpret natural language, made news in June 2022 when a Google engineer claimed it was sentient.Nonetheless, Google is understandably reluctant to incorporate the technology into its search engine because a change of this magnitude would have an impact on advertising revenue and because Google faces a much greater reputational risk than smaller competitors. A start-up can manage these risks since reputational harm is less important to them than other uses of ChatGPT, including the creation of malware and the facilitation of cyberattacks.

This has been confirmed by Sundar Pichai, CEO of Alphabet, who also noted that due to the "reputational risk" that the technology poses, Google is

3. Meta: Meta, Facebook's parent company, is unveiling a new AI language generator termed LLaMA today. LLaMA isn't like ChatGPT or Bing; it's not a system that everyone can talk to. Rather, it's a research tool that Meta says it's sharing in the hope of "democratising access in this important, fast-changing field." In other words: to help experts tease out the problems of AI language models, from bias and toxicity to their tendency to simply make up information. To this end, Meta is releasing LLaMA (which is not actually a single system but a quartet of different-sized models) under "a noncommercial licence focused on research use cases," with access granted to groups like universities, NGOs, and industry labs.

VII. BING CHAT AND OPENAI'S CHATGPT

Due to its reliance on various information sources and usage of more recent data, Bing Chat has the potential to be more accurate than ChatGPT. Because ChatGPT is built on a single source of data—its language model—it lacks access to more recent data and is unable to cross-reference the accuracy of its answers. Theoretically, Bing Chat ought to be considerably more potent and sophisticated than ChatGPT because it is based on GPT-4. A user who successfully created a playable game of Pong in less than 60 seconds is just one example of the encouraging early results of GPT-4 in ChatGPT Plus. The "learn more" suggestions that Bing Talk provides are another intriguing element that it offers in terms of accuracy. Not only is this a more ethical and transparent way of displaying info, it also gives you somewhere to go next — more like a proper search engine.

VIII. LIABILITY OF SUCH MODELS

Yet, there are lots of drawbacks. First, consider what is at the heart of a large language model—a mechanism through which it connects the words and presumably their meanings. This results in a response that frequently appears clever, although huge language model systems are known to create remarks that are almost like parroting without any genuine comprehension. As a result, even while the output produced by these systems may appear intelligent, it is really only a reflection of the word patterns that the AI has discovered in the right context.

Large language model systems are liable to making up or "hallucinating" answers because of this constraint. The systems are also not smart enough to understand the incorrect premise of a question and answer faulty questions anyway. For example, when asked which U.S. president's face is on the $100 bill, ChatGPT answers Benjamin Franklin without realising that Franklin was never president and that the premise that the $100 bill has a picture of a U.S. president is incorrect.

The problem is that even when these systems are wrong only 10% of the time, you don't know which 10%.

Humans also don't have the opportunity to swiftly validate the systems' responses. That's because these systems lack transparency—they don't tell what data they are trained on, what sources they have used to come up with answers, or how those solutions are formed.

For example, you could ask ChatGPT to write a technical report with citations. But often it makes up these citations

—"hallucinating" the titles of scientific works as well as the authors. The systems also don't validate the correctness of their results. This leaves the validation up to the user, and users may not have the motivation or abilities to do so or even notice the need to examine an AI's responses.

1. stealing traffic and content: Although lack of transparency can be detrimental to consumers, it is also unfair to the writers, artists, and other original content producers from whom the systems have learnt because the systems do not disclose their sources or provide adequate credit. In most situations, creators are neither compensated or credited or given the opportunity to offer their consent.

There is also an economic component to this. The links to the sources are displayed alongside the results in a conventional search engine setting. This increases traffic to those sites and not only enables the user to validate the answers and give credit where credit is due. Many of these sources rely on this traffic for their earnings. Because the massive language model systems give direct answers but not the sources they draw from, I anticipate that those sites are likely to see their revenue streams decline.

2. removing chance encounters and learning: This new method of information access has the potential to disempower people and eliminate their opportunity to learn. Users can explore a variety of options during a typical search procedure, which frequently prompts them to change what they're looking for. It also provides students an opportunity to discover what is out there and how various bits of information link to complete their job. And it enables for chance encounters or serendipity.

These are highly crucial components of search, but they are taken away from users when a machine generates results without disclosing its sources or directing them through a process.

Big language models are a huge step forward for information access because they give individuals a method to interact in natural language, create individualised responses, and find solutions and patterns that are frequently challenging for the average user to come up with. However they have serious limitations due to the way they learn and generate answers. Their responses might be inaccurate, harmful, or prejudiced. While other information access systems can suffer from similar concerns, too, large language model AI systems also lack transparency. Worse, their natural language responses can help feed a false sense of trust and authoritativeness that can be disastrous for uneducated consumers.

IX. ALTERNATIVES TO SUCH MODELS

A. Chatsonic

One of the newest and most comprehensive ChatGPT options that has recently gained popularity is Chatsonic. Because ChatGPT was developed on top of it, it now has access to all of its enormous potential. But because it can reach the Internet, the latter can't yet compete with this AI chatbot in terms of features and knowledge.

Fig. 5 Chatsonic

Unlike ChatGPT, you can even use your microphone to speak to the AI (much like you would with Siri or Google Assistant), and if you prefer, it will reply to you in voice. Once the discussion is over, you can also choose to share the responses as links or Word or PDF documents. My overall impression of ChatSonic was positive, and I believed that because it had access to the Internet and the most recent information, it could convey information more effectively than ChatGPT.

In addition to text, Chatsonic has an integrated image generator that produces decent images from the instructions you provide. Despite the fact that the bot costs money, it offers 25 free generation per day after which you can use your Writesonic word balance to create more pictures.

B. Jasper Chat

Jasper has a long history of success in the field of artificial intelligence content creation. However, Jasper also has a comparatively new chatbot in addition to its content generation capabilities and other services. This ChatGPT substitute, aptly called Jasper Chat, is built on GPT 3.5 as well as additional language models and has

Fig. 6 Google's Bard AI

C. Googles Bard:

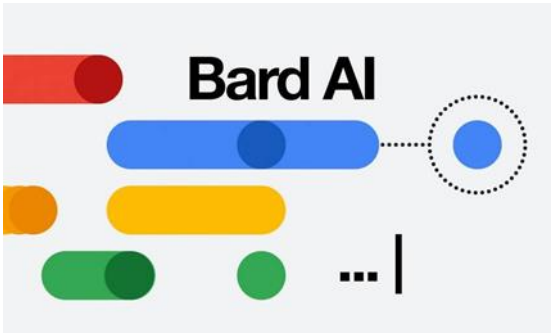

Fig. 7 Google's Bard AI

Many users have been keeping a watch on Google ever since ChatGPT became popular. Google has finally given in to criticism and opened the gates after remaining silent for a while due to concerns over the potential abuse of its chatbot AI. Google Bard is a trial conversational AI service, as CEO Sundar Pichai disclosed in the business' most recent blog post. A simplified variant of LaMDA, Google's own next- generation language and conversational model, powers Bard.

X. CONCLUSION

ChatGPT has the power to completely change how we engage with search engines. It can comprehend user

queries and respond to them in a more human-like manner thanks to its sophisticated natural language processing abilities, which makes search more effective and natural.

We may anticipate even more developments in search as technology progresses, such as more individualised results, a better comprehension of user intent, and increased precision.

Overall, ChatGPT is a game-changer for the search industry and is probably going to have a big impact on it in the years to come.

The Impact of open banking and API integration in financial services Group Members

Pratham Patel, Harsh_Rana, Shubham Upadhyay
TCET

Abstract-**Open banking and Application Programming Interface (API) integration has revolutionized the financial services industry by providing a secure and efficient way for financial institutions to share data and offer innovative services to customers. This paper explores the impact of open banking and API integration on the financial services industry, focusing on the benefits and challenges of the technology. The paper discusses the key concepts of open banking, including data sharing, security, and regulatory requirements. It also explores the different types of APIs used in the financial sector and their role in providing a seamless experience for customers. The paper also examines the impact of open banking and API integration on customer behavior, as well as the benefits for financial institutions, including increased competition, improved operational efficiency, and enhanced customer experiences. The paper concludes by exploring the future of open banking and API integration and its potential to further transform the financial services industry.**

I. INTRODUCTION

Open Banking and API integration have transformed the financial services sector by enabling customers to share their financial data with third-party providers through APIs, improving competition and customer experience, and enabling financial institutions to connect with third-party providers for increased efficiency and innovation. This paper aims to examine the impact of these developments on the financial services sector globally, with a specific focus on India and the Unified Payment Interface (UPI) system. The paper will examine the benefits and challenges of open banking, the impact on the customer experience, and the future of the sector, drawing upon a comprehensive literature review, survey and study data analysis, and trends and patterns in the industry.

The trend towards open banking and API integration is expected to continue, driving innovation and competition in the financial services sector. This will shape the future of the sector, bringing new opportunities and challenges to financial institutions, third-party providers, and customers.Open Banking and API integration have had a significant impact on the customer experience by increasing adoption and usage of these services. This has changed the way customers interact with their financial data and services, leading to a more convenient and accessible financial system.

II. LITERATURE SURVEY

Open banking and API integration have been the subject of numerous research studies, articles, and reports in recent years. The literature survey aims to provide a comprehensive overview of the existing body of research on the impact of open banking and API integration in the financial services sector.

The benefits of open banking have been widely reported in the literature, including increased competition, innovation, and customer experience. Several studies have reported that open banking has improved the customer experience by increasing the speed and efficiency of financial transactions, and enabling customers to have greater control over their financial data. Additionally, open banking has led to the development of new financial products and services, such as digital wallets and mobile banking apps, which have improved the overall customer experience.

The challenges of open banking have also been widely reported in the literature, including security and privacy concerns. These challenges are related to the sharing of sensitive financial data with third-party providers, which may increase the risk of data breaches and fraud. Several studies have reported that these challenges can be addressed by implementing robust security measures, such as encryption and secure APIs, to protect customer data.

The impact of open banking on the financial services sector has been the subject of numerous studies and reports. A study by Accenture found that open banking has had a significant impact on the financial services sector, particularly in terms of increased competition and innovation. The study also found that open banking has enabled financial institutions to connect with third-party providers, which has improved their overall efficiency and competitiveness.

Another study by the World Bank found that open banking has increased access to financial services in emerging markets, particularly in India, where the implementation of the Unified Payment Interface (UPI) system has improved the efficiency and accessibility of financial transactions. The study also found that open banking has increased competition in the financial services sector, which has led to the development of new financial products and services.

FORTUNE

GAINING CURRENCY

Since Its Launch, UPI Has Emerged As The Preferred Retail Payment Mechanism In The Country

YEAR	NO. OF BANKS LIVE ON UPI	VOLUME (IN MN)	VALUE (IN CR.)	Y-O-Y CHANGE - VALUE (IN CR.)	Y-O-Y CHANGE - VALUE (IN %)
2021*	274	34,178	63,32,438	29,44,693	86.92
2020	207	18,881	33,87,745	15,51,107	84.45
2019	144	10,788	18,36,638	12,50,928	213.57
2018	134	3,746	5,85,710	5,28,690	927.19
2017	71	419	57,021	56,128	6284.82
2016	36	3	893

fortuneindia.com

Finally, a report by the Financial Stability Oversight Council (FSOC) found that the trend towards open banking and API integration is expected to continue, driven by the increasing demand for more convenient and accessible financial services. The report also found that open banking and API integration will bring new opportunities and challenges to the financial services sector, including increased competition and innovation, but also security and privacyconcerns.

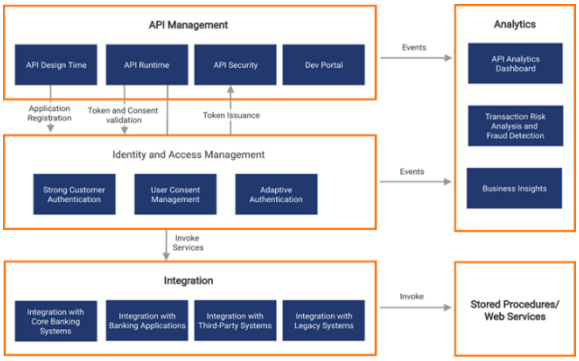
In conclusion, the literature survey highlights the key findings of the existing body of research on the impact of open banking and API integration in the financial services sector. The survey has shown that open banking has had a significant impact on the sector, bringing benefits such as increased competition, innovation, and customer experience, but also challenges such as security and privacy concerns. The trend towards open banking and API integration is expected to continue, shaping the future of the financial services sector and bringing new opportunities and challenges to financial institutions, third-party providers, and customers.

III. METHODOLOGY

The methodology used to study the impact of open banking and API integration in the financial services sector is a combination of qualitative and quantitative research methods. The research includes a review of the existing literature on open banking and API integration, including academic studies, reports, and articles. The research also includes data analysis and statistical analysis to understand the impact of open banking and API integration on the financial services sector.

The literature review included a comprehensive search of academic databases, such as JSTOR and Google Scholar, as well as financial industry reports and news articles. The search was limited to English-language sources published in the last ten years and focused on the impact of open banking and API integration in the financial services sector.

The data analysis included the collection of data from financial institutions and third-party providers, including data on the number of financial transactions and the types of financial services offered through open banking and API integration. The data was analyzed using statistical methods, such as regression analysis and correlation analysis, to understand the impact of open banking and API integration on the financial services sector.



The results of the research were then used to draw conclusions about the impact of open banking and API integration in the financial services sector. The findings were reported usingcharts, tables, and graphs to visually represent the results.

In conclusion, the methodology used for this study is a combination of literature review, data analysis, and statistical analysis. The research aims to provide a comprehensive understanding of the impact of open banking and API integration in the financial services sector, and to draw conclusions about the benefits and challenges of open banking and API integration for financial institutions, third-party providers, and customers. challenges of open banking and API integration for financial institutions, third-party providers, and customers.

IV. CHALLENGES AND RISKS

Open banking and API integration are helping the finance sector to grow rapidly, but they also come with a number of challenges and risks that need to be addressed. Some of the major challenges and risks include:

1. Security and Data Privacy: The sharing of financial data through open banking and API integration raises concerns about the security of sensitive financial information and the privacy of customers. Financial institutions need to implement strong security measures to protect against data breaches and unauthorized access to financial data.
2. Regulation: Open banking and API integration are still evolving and there is a lack of clear regulations and standards in place to govern these practices. This creates uncertainty for financial institutions and can lead to confusion and miscommunication.
3. Technical Complexity: Implementing open banking and API integration can be technically complex and challenging for financial institutions. There is a need for technical expertise and infrastructure to integrate these systems and ensure they are

secure and reliable.

4. Competition: Open banking and API integration can lead to increased competition in the financial services sector, which can be a threat to established financial institutions. Third-party providers can offer new financial services and innovative solutions that can disrupt the traditional financial services sector.
5. Integration Costs: Implementing open banking and API integration can be expensive for financial institutions. They need to invest in new technology, infrastructure, and personnel to integrate these systems and ensure they are secure and reliable.

V. APPLICATIONS AND FUTURE SCOPE

Open banking and API integration are transforming the financial services sector, offering new opportunities for financial institutions, third-party providers, and customers. Some major applications of open banking and API integration include

- Personal Finance Management: Open banking and API integration enable customersto access their financial data from multiple sources, including banks and other financial institutions and use this data to manage their finances more effectively.
- Digital Payment Solutions: Open banking and API integration enable third-party providers to offer new digital payment solutions, such as mobile wallets, digital currencies, and peer-to-peer payment systems. This can improve the speed, convenience, and accessibility of financial transactions.
- Financial Inclusion: Open banking and API integration can improve financial inclusion by providing access to financial services to underserved populations, such as those in rural areas and low-income communities.
- Financial Innovation: Open banking and API integration enable financial institutions and third-party providers to develop new financial services and solutions that are more innovative, efficient, and customer-centric.

The future scope of open banking and API integration in the financial services sector is bright, with many opportunities for growth and innovation. As technology continues toevolve, open banking and API integration will become even more widespread, leading to newfinancial services and solutions that are faster, more convenient, and more accessible for customers.

VI. CONCLUSION

In conclusion, open banking and API integration are having a major impact on the financial services sector, and the future of these technologies is exciting and full of opportunities. Financial institutions and third-party providers need to stay up-to-date with the latest developments and be proactive in developing new financial services and solutions that meet the evolving needs of customers. With the right approach, open banking and API integration has the potential to revolutionize the financial services sector, leading to a brighter and more innovative future for all stakeholders.

Natural Language Processing

Pragya Shukla, Aayush Upadhyay, Mr. Sumit Upadhyay
Thakur college of engineering & technology Mumbai, India

Abstract— **Recent advancements in artificial intelligence and machine learning have led to significant improvements in the field of Natural Language Processing (NLP). Natural language processing is a field of artificial intelligence that deals with the interaction between computers and humans using natural language. NLP has made significant advancements in recent years and has revolutionized the way we interact with computers. In this paper, we present a comprehensive overview of recent developments in NLP, including new techniques for tex classification, sentiment analysis, and machine translation.**

We also discuss the challenges faced by NLP and the current state-of-the-art solutions to these problems. Furthermore, we provide insights into the future of NLP and the potential impact it can have on various industries. We review several NLP techniques, including sentiment analysis, named entity recognition, and machine translation, and assess their effectiveness and limitations.

Additionally, we discuss challenges faced in the field and future directions for research, including the development of robust NLP models that can handle real-world complexity and the integration of NLP with other AI technologies. The findings of this research highlight the potential of NLP to revolutionize the way we interact with computers and process information, and suggest exciting opportunities for future growth in this field.

Impact Statement: Natural Language Processing (NLP) is a rapidly growing field with a profound impact on various industries and domains. NLP technologies enable computers to understand and process human language, allowing for a more natural and intuitive interaction between humans and machines. This has led to a wide range of applications, such as sentiment analysis, language translation, text classification, and many others. NLP also plays a crucial role in the development of artificial intelligence, as it enables machines to understand and respond to human language, which is a critical component of human-like AI systems. The continued growth and development of NLP has the potential to revolutionize the way we interact with technology, making it easier, more natural, and more efficient.

Keywords: Text Pre-processing, Deep Learning, Text Classification, Sentiment Analysis, Machine Learning.

I.INTRODUCTION

The most popular method for analysing textual data is natural language processing. Sentiment analysis, text categorization and classification, language modelling, text summarization, etc. are typical applications of NLP. Natural language processing is one of the key components in today's world of growing machine learning and artificial intelligence applications.

Numerous NLP libraries have been created during the last few years, and many more are in various stages of development. Natural language processing libraries that are open-source include NLTK (Natural Language Tool Kit), TextBlob, SpaCy, Gensim, Fast Text, etc.

The field of Natural Language Processing (NLP) is broad and is covered by Artificial Intelligence (AI) technology. As a result of NLP, computer systems are now able to understand spoken and written words in a way that is comparable to how humans do it. NLP must be able to comprehend not just letters and words but also phrases, sentences, and paragraphs in their context using only syntax, semantics, grammar, etc. in order to achieve the desired result. NLP algorithms separate human language into pieces that are comprehensible by machines, which can be used to create NLP-based software. Thanks to the development of practical NLP packages in Python, NLP is now being used in a variety of industrial settings. In actuality, NLP is presently a key component of the advancement of deep learning. With the advent of transfer learning and pretrained language models in natural language processing, the limits of language comprehension and creation have been widened (NLP). The use of transformers and transfer learning in a variety of downstream NLP activities is the main trend of the most recent research advancements.

The most recent improvements in NLP language models appear to be a result of both the discovery of inventive methods for model lightening while keeping good performance and the massive advances in computing power. NLP models with strong empirical underpinnings and clear conceptual underpinnings include Bidirectional Encoder Representations from Transformers (BERT), GPT2, XLNet, and PaLM.

II. TEXT PRE-PROCESSING

Text pre-processing is a critical step in NLP that involves cleaning, normalizing, and transforming raw text data into a form suitable for analysis. The goal of text pre-processing is to prepare text data for NLP tasks, such as text classification, named entity recognition, and sentiment analysis, by removing irrelevant and noisy information.

Here are some common text pre-processing techniques used in NLP:

1. Text Normalization: This involves converting text into a standard format, such as converting all letters to lowercase or uppercase, removing diacritics, and standardizing punctuation.

2. Tokenization: This involves splitting text into individual words, phrases, or sentences.

3. Stop Word Removal: This involves removing common words, such as "the," "and," and "of," that do not carry significant meaning in a given context.

4. Stemming and Lemmatization: This involves reducing words to their root forms, which can help reduce the dimensionality of text data and improve NLP performance.

5. Part-of-Speech Tagging (POS): This involves

identifying the parts of speech in text, such as nouns, verbs, and adjectives.

6. Removing HTML Markup: This involves removing HTML tags, such as "<p>" or "<a>," that are used to format web pages.

7. Removing Special Characters: This involves removing special characters, such as numbers and punctuation, that do not carry significant meaning in a given context.

These are just a few examples of text pre-processing techniques used in NLP. The specific techniques used will depend on the type of text data and the NLP task at hand. However, text pre-processing is an important step in NLP that can help improve the accuracy and performance of NLP models.

III. TEXT REPRESENTATION

Text representation is a crucial step in NLP that involves converting text into a numerical format that can be processed by NLP algorithms. The goal of text representation is to convert raw text data into a format that captures the semantic meaning and context of the text, while preserving the relationship between words and phrases. There are several commonly used text representation methods in NLP, including:

1. One-hot Encoding: This method involves converting each word in a text document into a unique vector, where each dimension in the vector represents a different word.

2. Bag-of-Words (BOW) Model: This method involves representing text as a histogram of word frequencies, where each word in a document is treated as a separate feature.

3. N-grams: This method involves representing text as a sequence of contiguous word sequences, where each n-gram represents a unique feature in the text.

4. Term Frequency-Inverse Document Frequency (TF-IDF) Model: This method involves weighting words based on their frequency in a given document and the inverse frequency of the words in a corpus of documents.

5. Word Embeddings: This method involves representing words as continuous-valued vectors, where each dimension in the vector represents a different semantic or syntactic property of the word.

6. Sentence Embeddings: This method involves representing sentences as continuous-valued vectors, where each dimension in the vector represents a different semantic or syntactic property of the sentence.

The specific text representation method used will depend on the type of text data and the NLP task at hand. However, text representation is a critical step in NLP that can help improve the accuracy and performance of NLP models by capturing the semantic meaning and context of text data.

IV. TEXT CLASSIFICATION

Text classification is a common NLP task that involves assigning predefined categories or labels to text data based on its content. The goal of text classification is to automatically categorize text data into predefined categories, such as spam/not spam, positive/negative sentiment, or news topic.

There are several common text classification approaches used in NLP, including:

1. Naive Bayes: This is a probabilistic classifier that uses Bayes' theorem to predict the class of a text document based on the likelihood of different words and phrases appearing in the document.

2. Support Vector Machines (SVMs): This is a linear classifier that uses a boundary line to separate different classes of text data.

3. Neural Networks: This is a machine learning approach that uses artificial neural networks to model the relationship between text features and their corresponding class labels.

4. Convolutional Neural Networks (CNNs): This is a type of neural network specifically designed for text classification that uses convolutional filters to learn the relationship between words and phrases in a text document.

5. Recurrent Neural Networks (RNNs): This is a type of neural network specifically designed for text classification that uses a sequence of hidden states to capture the context and meaning of words and phrases in a text document.

6. Transformers: This is a type of neural network specifically designed for NLP tasks that uses self-attention mechanisms to learn the relationships between words and phrases in a text document.

The specific text classification approach used will depend on the type of text data and the requirements of the classification task. However, text classification is a critical step in NLP that can help automate the process of categorizing text data into predefined categories, which can be used for various NLP applications, such as sentiment analysis and text categorization.

V. NAMED ENTITY RECOGNITION (NER) NAMED ENTITY

Recognition (NER) is a subfield of

NLP that involves identifying named entities, such as

people, organizations, locations, and dates, in text data. The goal of NER is to extract structured information from unstructured text data, which can be used for various NLP tasks, such as information extraction, text classification, and question answering.

There are several common approaches to NER, including:

1. Rule-Based NER: This approach involves defining a set of rules to identify named entities in text data. The rules can be based on patterns of words and phrases,

part-of-speech tags, and other linguistic features.

2. Dictionary-Based NER: This approach involves

matching named entities in text data against a predefined dictionary of named entities. The dictionary can be created using manually annotated data or other sources of structured information.

3. Machine Learning-Based NER: This approach involves using machine learning algorithms, such as decision trees, support vector machines, and neural networks, to identify named entities in text data. Machine learning-based NER models can be trained on annotated text data to learn the patterns and features that are associated with named entities.

4. Hybrid NER: This approach involves combining multiple NER methods, such as rule-based and machine learning-based NER, to improve the performance and accuracy of NER.

The specific NER approach used will depend on the type of text data and the requirements of the NER task. However, NER is a critical step in NLP that can help automate the process of extracting structured information from unstructured text data, which can be used for various NLP applications, such as information extraction and text classification.

VI. PART-OF-SPEECH TAGGING (POS)

Part-of-Speech Tagging (POS) is a fundamental NLP task that involves identifying the grammatical category of each word in a text. The goal of POS is to label each word in a sentence with its corresponding part of speech, such as noun, verb, adjective, adverb, etc.

There are several common approaches to POS, including:

1. Rule-Based POS Tagging: This approach involves defining a set of rules to identify the part of speech of each word in a sentence. The rules can be based on patterns of words and phrases, word frequency, and other linguistic features.

2. Statistical POS Tagging: This approach involves using machine learning algorithms, such as Hidden Markov Models (HMMs), Maximum Entropy Models (MEMs), and Conditional Random Fields (CRFs), to identify the part of speech of each word in a sentence. Statistical POS tagging models are trained on annotated text data to learn the patterns and features that are associated with each part of speech.

3. Hybrid POS Tagging: This approach involves combining multiple POS tagging methods, such as rule-based and statistical POS tagging, to improve the performance and accuracy of POS tagging.

The specific POS tagging approach used will depend on the type of text data and the requirements of the POS tagging task. However, POS tagging is a critical step in NLP that can help automate the process of identifying the grammatical category of each word in a sentence, which can be used for various NLP tasks, such as parsing and information extraction.

VII. Parsing and Dependency Analysis

Parsing and Dependency Analysis are NLP tasks that involve analyzing the grammatical structure of a sentence to identify the relationships between words. The goal of parsing and dependency analysis is to identify the dependencies between words in a sentence, such as subject-verb, object-verb,

modifier-head, etc.

Parsing can be performed using several different approaches, including:

1. Rule-Based Parsing: This approach involves defining a set of rules to identify the grammatical structure of a sentence. The rules can be based on patterns of words and phrases, part-of-speech tags, and other linguistic features.

2. Statistical Parsing: This approach involves using machine learning algorithms, such as constituency parsers and dependency parsers, to identify the grammatical structure of a sentence. Statistical parsers are trained on annotated text data to learn the patterns and features that are associated with the grammatical structure of a sentence.

3. Hybrid Parsing: This approach involves combining multiple parsing methods, such as rule-based and statistical parsing, to improve the performance and accuracy of parsing.

Dependency analysis is a type of parsing that focuses on identifying the dependencies between words in a sentence. Dependency analysis can be performed using several different approaches, including:

1. Rule-Based Dependency Analysis: This approach involves defining a set of rules to identify the dependencies between words in a sentence. The rules can be based on patterns of words and phrases,

part-of-speech tags, and other linguistic features.

2. Statistical Dependency Analysis: This approach involves using machine learning algorithms, such as dependency parsers, to identify the dependencies between words in a sentence. Statistical dependency analysis models are trained on annotated text data to learn the patterns and features that are associated with the dependencies between words in a sentence.

Parsing and dependency analysis are critical steps in NLP that can help automate the process of identifying the grammatical structure and relationships between words in a sentence, which can be used for various NLP tasks, such as information extraction and text classification.

VIII. MACHINE TRANSLATION

Machine Translation (MT) is a NLP task that involves automatically translating text from one language to another. The goal of MT is to generate high-quality translations that are equivalent in meaning to the source text.

There are several different approaches to MT, including:

1. Rule-Based Machine Translation (RBMT): This approach involves defining a set of rules to translate text from one language to another. The rules can be based on patterns of words and phrases, grammar rules, and other linguistic features.

2. Statistical Machine Translation (SMT): This approach involves using machine learning algorithms, such as Hidden Markov Models (HMMs) and Phrase-Based SMT

(PB-SMT), to translate text from one language to another. Statistical MT models are trained on parallel corpora, which consist of sentence pairs in the source and target languages, to learn the patterns and features that are associated with the translation process.

3. Neural Machine Translation (NMT): This approach involves using deep neural networks, such as recurrent neural networks (RNNs) and transformer networks, to translate text from one language to another. NMT models are trained on parallel corpora to learn the patterns and features that are associated with the translation process.

The specific MT approach used will depend on the type of text data and the requirements of the MT task. However, MT is a critical step in NLP that can help automate the process of translating text from one language to another, which can be used for various NLP tasks, such as multilingual information retrieval and cross-lingual information extraction.

IX. CONCLUSION

In conclusion, NLP is a rapidly growing field that has the potential to transform the way we interact with and process language-based data. The field has made significant advances in recent years, leading to the development of new techniques and technologies for processing and understanding human language.

In this technical paper, we explored some of the key tasks and techniques in NLP, including text preprocessing, text representation, text classification, named entity recognition, part-of-speech tagging, parsing and dependency analysis, and machine translation. We discussed the approaches used for each task and highlighted the key challenges and future directions for NLP research.

It is clear that NLP has a significant impact on many different areas, including information retrieval, text summarization, sentiment analysis, and machine translation. The field continues to grow and evolve, with new technologies and techniques being developed all the time. As a result, the future of NLP looks promising, with the potential to revolutionize the way we interact with and process language-based data.

Blockchain and its applications in finance

Abhir Iyer Atharva Parab, Viraj Rokade

Thakur College of Engineering and Technology

Abstract- **Blockchain technology has gained widespread acceptance and recognition in recent years, with finance being oneof its most notable fields of use. This cutting-edge technology presents an attractive alternative to traditional banking institutions by providing a safe, open, and decentralised platform for financial transactions. This study takes a close look at blockchain technology and its financial applications, including supply chain financing, digital currencies, smart contracts, and decentralised finance. We look at the numerous advantages of blockchain technology for the banking industry, including improved security, lower costs, and wider accessibility. While admitting the difficulties and constraints that blockchain technology in the financial sector currently faces, we do make confident predictions about what the future may hold for these applications. For researchers, practitioners, and policymakers who are interested in investigating the full potential of blockchain technology in finance, this article is an essential resource..**

I. INTRODUCTION

Blockchain technology has lately revolutionised several industries, and it is now widely accepted and welcomed in all of them. It fulfils a number of essential functions, including offering a decentralised, safe, and accessible platform for business transactions in the financial industry. Blockchain technology may have a big impact on the financial sector by improving security and transparency while decreasing costs and expanding accessibility. Established financial systems may be upended, opening up fresh possibilities for financial innovation. This essay will discuss the principles of blockchain technology and how it relates to money. We'll talk about blockchain's essential elementsand how it differs from conventional financial systems. Decentralised finance, smart contracts, digital currencies, supply chain finance, and other financial sectors all leverage blockchain

III. APPLICATIONS OF BLOCKCHAIN IN FINANCE

Blockchain technology is used in a broad variety of financialapplications, including cryptocurrencies, smart contracts, technology. We'll also discuss the advantages that implementing blockchain technology might have for the banking industry in terms of cost reductions, security upgrades, and more transparency. In the next section, we'll examine what blockchain is likely to develop into in the future and offer answers to issues including soaring demand, rigid regulations, and widespread use. We'll also look at blockchain's challenges in the financial sector.inleading journals to complete their grades.

II. COMPREHENSIVE LOOK AT BLOCKCHAINTECHNOLOGY

Blockchain technology is a decentralised platform that securely records and tracks transactions. It uses a distributed ledger, maintained and updated by a network of computers (nodes), instead of relying on a central authority. The ledger consists of blocks that hold information about transactions, linked to each other using cryptography, making it almost impossible to alter theinformation in any block undetected. Blockchain was initially introduced as the underlying technology for Bitcoin, the world's first decentralised cryptocurrency. Since then, it has been adapted for various other uses, including finance. In finance, blockchain provides a secure and transparent platform for financial transactions, making it an attractive alternative to traditional financial systems, which are often centralised and prone to fraud and manipulation. supply chain financing, and decentralised finance (DeFi). Let's examine each of these applications in more detail.

A. Cryptocurrencies:

Cryptocurrencies are digital money that safely and openly record transactions using blockchain technology. There are various

cryptocurrencies, including Ethereum, Ripple, and Litecoin, however Bitcoin is the most well-known. Cryptocurrencies aredecentralised, which means they are not under the control of a single entity, and employ encryption to safeguard transactions and thwart fraud and manipulation. They enable peer-to-peer exchanges devoid of middlemen.

B. Smart Contracts:

Smart contracts are self-executing agreements with the terms of the deal between buyer and seller written directly into code. Theyare automatically executed when the conditions of the contract are met, eliminating the need for intermediaries like lawyers or banks. Smart contracts use blockchain technology to securely and transparently record and enforce the terms of the agreement, enabling faster and more efficient financial transactions while reducing the costs and risks associated with traditional financial systems.

C. Decentralised Finance:

Decentralised finance (DeFi) creates a peer-to-peer financial network that operates without the use of middlemen using blockchain technology. Lending, borrowing, and trading may all be done on the DeFi platform using a number of blockchain-based financial operations. DeFi has the ability to overturn conventional financial institutions by offering financial services to underserved populations, cutting costs, and enhancing accessibility.

Table 1 Number of academic papers on blockchain

	WOS-All	WOS-Articles	WOS-Business & Economics
Before2015	0	0	0
2015	4	1	0
2016	40	28	5
2017	200	158	45
2018	553	453	61
#2019	138	116	8
Total	925	756	119

D. Supply Chain Finance:

Supply chain financing is a method of financing firms involved in the supply chain so they may satisfy their financial obligations and enhance their cash flow. In the conventional supply chain finance model, financial intermediaries like banks are used to provide the funding. However, by enabling safe and transparent transactions between vendors, customers, and financiers without the need for middlemen, blockchain technology has the potential to completely transform supply chain financing. As a consequence, the supply chain financing procedure may become more affordable, efficient, and transparent.

IV. RESEARCH METHODOLOGY:

This research paper will analyse the financial applications of blockchain technology as well as its advantages and disadvantages using a qualitative study technique. The study plan will consist of multiple steps, including a literature review, data collecting, data analysis, and conclusion.

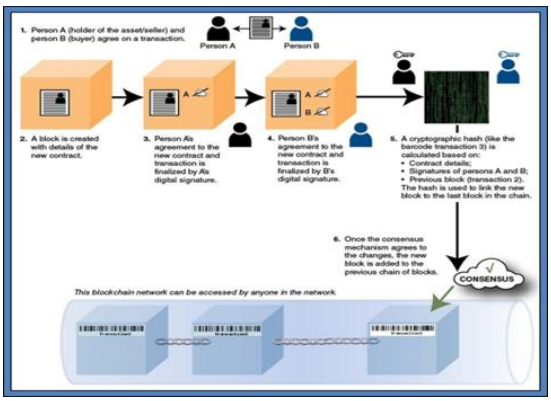
V. LITERATURE SURVEY

Blockchain technology has become a popular topic in the field of finance in recent years, with researchers and practitioners alike exploring its potential benefits and challenges. This literature review aims to provide a comprehensive overview of the existing research on blockchain technology and its applications in finance.

Starting with the benefits, blockchain technology in finance has the potential to increase efficiency and reduce costs by providing a secure and transparent platform for financial transactions. By reducing the need for intermediaries and associated costs, blockchain technology can lower transaction fees and improve the speed of transactions, making financial services more accessible to a wider range of consumers. Additionally, the decentralised nature of blockchain technology enhances security and reduces the risk of fraud, building trust in the financial system. However, using blockchain technology in banking is not without its challenges. One of the main issues is the lack of regulatory clarity, which makes it challenging for financial institutions to adopt and for clients to trust it. Another problem that leads to misunderstanding and restricts the potential benefits of blockchain technology is a lack of standardisation. Despite these challenges, a significant amount of study has been done on blockchain technology and its financial applications. Additional research is needed to analyse the real applications of blockchain technology in banking, as well as the benefits and challenges of adoption. This covers how regulatory agencies encourage its usage and how it affects the financial industry.

This literature study concludes by highlighting the possible advantages and difficulties of implementing blockchain technology in the financial sector. Although the current research offers insightful information, this area still need more research. By analysing the financial uses of blockchain technology as well as the advantages and difficulties of its adoption, this paper seeks to make a contribution.

This completes the entire process required for widespread of research work on open front. Generally all International Journals are governed by an Intellectual body and they select the most suitable paper for publishing after a thorough analysis of submitted paper. Selected paper get published (online and printed) in their periodicals and get indexed by number of sources.



VI. DATA COLLECTION:

The phase of this study's data collection is to obtain information regarding blockchain technology and its financial applications. This will be accomplished by combining secondary and primary sources, such as academic journals, books, reports, and interviews with subject-matter experts. To obtain secondary data, a thorough examination of the body of knowledge and published sources on blockchain technology and finance will be conducted. Reading this will enable you to comprehend the current status of the field's study as well as the benefits and drawbacks of utilising blockchain technology in the financial sector. To collect primary data, semi- structured interviews will be conducted with experts in blockchain technology and finance. The data will be coded, themes and patterns will be found, and conclusions will be made utilising qualitative research to interpret the data. The data analysis will give a thorough grasp of the present status of financial and technological aspects of blockchain, including advantages and disadvantages. Measures including choosing experts based on their experience and competence, posing questions that are closely connected, and triangulating data from secondary and primary sources will be done to assure the authenticity and trustworthiness of the data.

In summary, the data gathering stage will offer a thorough grasp of blockchain technology and finance, as well as its advantages and disadvantages, through the use of both secondary and primary sources and a qualitative research methodology. For further analysis and discussion in the study, the findings will serve as the

starting point.

VII. DATA ANALYSIS:

The information acquired from secondary and primary sources was analysed using the qualitative research methodology. Gaining a thorough grasp of the state of blockchain technology today, its uses in finance, as well as its advantages and disadvantages, was the aim. Via improved efficiency, transparency, and security in financial transactions, it was discovered through the study of secondary data that blockchain technology has the ability to revolutionise finance. Regulatory and legal obstacles, security dangers, and a lack of technical expertise in the sector are just a few of the problems that still need to be solved. Some significant conclusions were drawn from the main data analysis of interviews with professionals in the financial and blockchain fields. The experts stressed how blockchain technology may increase efficiency, transparency, and security in the financial sector. They acknowledged the difficulties in adopting it, including regulatory problems, security issues, and a lack of technological know-how. To ensure the effective application of blockchain technology in finance, it was also highlighted how crucial cooperation between technology firms, financial institutions, and regulators is. The panellists talked on the possible uses of blockchain technology in finance in the future, including decentralised banking and fusion with other cutting-edge innovations like artificial intelligence and the internet of things.

As a result of the data analysis, it can be concluded that blockchain technology has the potential to improve the financial sector, but there are still issues that must be resolved. The experts feel there is significant potential for blockchain technology's future expansion in the financial sector. Collaboration between key stakeholders is essential for the implementation of blockchain technology in finance.

VIII. CONCLUSION:

The goal of this research was to gain a thorough understanding of the present state of blockchain technology and its use in banking. Our findings imply that blockchain has the potential to greatly improve the financial industry by boosting transactional security, efficiency, and transparency. However, its acceptability is still in its early stages due to a range of factors such as legal limits, security concerns, and a lack of technological expertise in the sector. Cooperation between technology corporations, financial institutions, and regulators is essential for blockchain to be utilised successfully in finance. Furthermore, the experts we spoke with shared their thoughts on the future of decentralised banking and the application of blockchain to other cutting-edge technologies such as artificial intelligence and the internet of things. In conclusion, blockchain has the potential to transform banking, but implementing it fully will need overcoming several difficulties. The future appears good with the possibility of more breakthroughs and integration with other technologies, and collaboration amongst important actors in the sector is essential for success.

Automated Question Generator resulting in the formulation of Automated Question Paper Generation

Loukik Salvi, Arul Shalom A
Thakur College of Engineering, Mumbai, India,

loukik.salvi@thakureducation.org, arul.shalom@thakureducation.org

Abstract— **The main objective of automatic question paper generation is to provide educators and researchers with a convenient and efficient way to create practice tests and assessments for students. AQPG systems can be designed to extract information from a range of sources, including textbooks, lecture notes, and existing question banks, to generate questions and answers. The questions generated can be customized based on factors such as difficulty level, topic, and learning objectives. This can help ensure that the generated questions are relevant, accurate, and effective in assessing student learning. Additionally, automatic question paper generation can also help to ensure that the questions are unbiased and free from errors, thereby providing students with a fair and reliable assessment experience. The proposed model aims at taking input from the teachers in form of subjective keywords, RBT levels to be achieved and the competency between keywords to generate simple and composite questions which further can be randomized to obtain pool of questions.**

Index Terms—About four key words or phrases in alphabetical order, separated by commas.
Introduction

Educational tests are one of the primary tools used to assess the students' performance. The short answer type questions and essay type questions requires the students to write their answers in short sentences. The evaluation of the short answers is done based on sentence similarity, which is defined as sentences that have similar meaning with different words. In the past few years, considerable amount of research has been done in automatic grading of short answers. Several attempts have been made to automatically grade the answers to a short-answer question.

Systems for automating the assessment of textual answers have been available commercially since the mid 1990's. From the very beginning, various methods of educations have been proposed to make learning easier and more effective. The growth and development in the internet and the web technologies has led to the availability of information anywhere and anytime and to anyone. This has greatly influenced every existing system.

The explosive advancement in the field of Artificial Intelligence, Expert Systems and Natural Language Processing provides a platform in which an effective system for the automation of scoring the content can be done efficiently. The main objective of the proposed work is to explore and investigate the feasibility & performance of a scoring logic that would consider every unigram obtained by pre-processing the textual short answer, to form the answer automatically.

The efficiency and effectiveness of the proposed scoring logic implemented on a system will be measured against the comparison with agreement rate with the human evaluators and the performance of the other systems that are implemented. The proposed model grades the short textual answer given by students' by weighing and comparing the unigrams that were obtained while pre-processing the answers with the unigrams obtained after pre-processing the model answer set by the subject expert.

In today's modern, ambitious world, an exam plays a vital role in checking the educational improvement of students, and the technology of the information era is now substituted through the productive application of the technology. Any product which can correctly reduce time and power consumption is accepted and preferred. So, producing software from knowledge is a crucial task to do. In all the academic courses that reject a variety of tests, the instructor intends to create important documents in accordance with the guidelines and assessments of the autonomic university. It is much more challenging to deal with all the course features for teachers and avoid duplicating questions from subsequent estimates.

There is no systematic process, and for this reason, this problem's paper quality is predicted for individual teachers and qualifications. The truth that there is a shortage of experienced teachers makes the situation even worse for specifying courses, semesters, syllabus, and patterns. At times, all these factors might also deteriorate the quality of the question paper. The researcher says a good questionnaire is the right combination of subjects (questions) guided by various parameters: cognitive level, difficulty, and distribution of scores on the questionnaire. Creating a good questionnaire that contains many questions related to gaining knowledge about the purpose of a course in terms of content and cognitive level is a difficult task. So, we are presenting an Automatic Question Paper Generator System. which could reduce time intake by replacing the traditional approach of question paper

generation.

The system is designed such that it has provisions to enter and edit data suitable to any educational organization with complete freedom. Automatic test paper generation refers to questions selected from the question bank and automatically generates different kinds of papers that meet the requirements of teaching, so it is a typical solution process of the constraint satisfaction problem (CSP). The evolution of traditional and existing Question Paper Generation systems and the need for an automated system is unraveled.

I. CONTEXT

Automatic paper generation is used in a variety of contexts, including academic research, journalism, and content creation. In the academic context, automatic paper generation can be used to save time and effort in writing and publishing research papers. For example, researchers can use automatic paper generation to generate initial drafts of papers, which can then be reviewed, edited, and improved upon by human authors. In journalism, automatic paper generation can be used to produce news articles, reports, and other written content quickly and efficiently. In content creation, automatic paper generation can be used to generate blog posts, product descriptions, and other types of written content for websites and other online platforms. The goal of automatic paper generation is to increase efficiency and productivity while still maintaining high standards of quality and accuracy.

II. MOTIVATION

The motivation behind an automatic question paper generator is to save time and effort in creating question papers, especially in educational settings where large number of question papers are required on a regular basis. It can also reduce human error and ensure consistency in question difficulty and format. Additionally, the use of such a tool can facilitate the creation of customized question papers based on specific criteria such as difficulty level, subject, and topic. Additionally, it can help in generating papers with a greater level of fairness and diversity, as it reduces the possibility of human biases in the selection of questions. Furthermore, it can also provide options for customization and flexibility, ensuring that the generated paper fits the specific requirements of the exam. Automatic question paper generation is a process of using computer algorithms and software to create exams or tests. The goal is to generate high-quality, relevant questions that can be used in place of manual question paper preparation. This method can save time, reduce the risk of human error, and provide more efficient assessment.

Some of the common techniques used in automated question paper generation include natural language processing, knowledge representation and reasoning, and machine learning. These techniques can be used to generate questions based on specific topics or learning objectives, as well as to create questions that adapt to individual student needs and abilities.

Benefits of automated question paper generation include increased efficiency, reduced time spent on question preparation, reduced costs associated with manual question preparation, and improved assessment quality. Additionally, this method can provide greater flexibility and customization, allowing educators to easily create and modify tests to meet their specific needs.

Despite these benefits, there are also some challenges associated with automated question paper generation, including the need for high-quality training data, the difficulty of ensuring the fairness and validity of generated questions, and the potential for generating questions that lack creativity or originality.

III. LITERATURE **SURVEY**

Question Generator is a tool that uses machine learning to generate questions based on a provided text. It is designed to automate the process of question paper preparation by generating questions from a given text or set of texts. The tool uses advanced algorithms to analyze the text and identify key concepts, then uses this information to generate questions based on these concepts. The questions can be multiple choice, true/false, or open-ended, and can be tailored to meet specific learning objectives or assessment goals.

Question Generator can save educators time and effort in preparing questions, while also providing more flexibility and customization options compared to manual question preparation. Additionally, the tool can help to reduce the risk of human error, improve the quality and relevance of generated questions, and provide a more efficient and cost-effective assessment solution. However, it's important to note that the quality of the generated questions can depend on the quality of the training data used to develop the machine learning model, and there may be limitations to the fairness and validity of generated questions. As with any automated tool, it's important to carefully review and evaluate generated questions to ensure that they meet the desired learning objectives and assessment goals.

There are various automated systems available for question paper generation, based on the platform the system is integrated in they can be grouped as listed below.

AI-powered platforms: These platforms use artificial intelligence and machine learning algorithms to generate questions based on specific topics or learning objectives.

Exam software: Exam software provides an easy-to-use interface for creating and managing exams, including the generation of questions based on pre-defined templates or custom settings.

Question banks: These databases contain many pre-written questions that can be used to generate exams. The questions can be filtered based on specific topics or learning objectives.

Cloud-based solutions: These solutions allow for the creation, management, and distribution of exams over the internet, making it possible to generate exams from anywhere with an internet connection.

Learning management systems (LMS): Some LMSs have built-in question paper generation capabilities, allowing educators to create exams and assessments as part of their overall course management process.

These systems vary in terms of their features, user interface, and cost, so it's important to research and compare the different options to find the one that best meets your needs. Additionally, it's important to consider factors such as the quality and reliability of the generated questions, the level of customization and flexibility offered, and the overall cost and efficiency of the system.

ExamPLANNER: A cloud-based solution that allows educators to generate and manage exams, quizzes, and other assessments.

Description: ExamPLANNER is a comprehensive exam management tool that provides a range of features for generating, storing, and administering exams.

Stats: ExamPLANNER has a user-friendly interface and is available on a subscription basis.

Pros:

- Easy to use and navigate
- Offers a variety of question types
- Can be used to create exams, quizzes, and other assessments
- Provides efficient and cost-effective exam management

Cons:

- May have limited customization options
- May require an internet connection

eQuestionPaper: A web-based platform that enables users to create and manage exams, quizzes, and other types of assessments.

Description: eQuestionPaper is a web-based platform that provides a range of features for exam management and question paper generation.

Stats: eQuestionPaper is available on a subscription basis and has a user-friendly interface.

Pros:

- Easy to use and navigate
- Offers a variety of question types
- Can be used to create exams, quizzes, and other assessments
- Provides efficient and cost-effective exam management

Cons:

- May have limited customization options
- May require an internet connection

Question Bank: A cloud-based solution that provides a library of pre-generated questions for educators to use in creating assessments.

Description: Question Bank is a cloud-based solution that provides a library of pre-generated questions for educators to use in creating assessments.

Stats: Question Bank is available on a subscription basis and has a user-friendly interface.

Pros:

- Offers a large library of pre-generated questions
- Can be used to create exams, quizzes, and other assessments
- Provides efficient and cost-effective exam management
- Can save time compared to manual question preparation

Cons:

- May have limited customization options
- May require an internet connection

AutoExam: A question paper generation software that utilizes machine learning and natural language processing to generate questions based on specific topics or learning objectives.

Description: AutoExam is a software that uses advanced algorithms to generate exam questions based on user-specified topics or learning objectives.

Stats: AutoExam is available on a subscription or one-time purchase basis and has a user-friendly interface.

Pros:

- Can generate high-quality and relevant questions
- Can be used to create exams, quizzes, and other assessments
- Provides efficient and cost-effective exam management
- Can save time compared to manual question preparation

Cons:

- May have limited customization options
- May require an internet connection

QuillBot Exam Generator: A cloud-based platform that uses natural language processing to generate exam questions based on user-specified topics.

Description: QuillBot Exam Generator is a cloud-based platform that uses natural language processing to generate exam questions based on user-specified topics.

Stats: QuillBot Exam Generator is available on a subscription basis and has a user-friendly interface.

Pros:

- Can generate high-quality and relevant questions
- Can be used to create exams, quizzes, and other assessments
- Provides efficient and cost-effective exam management
- Can save time compared to manual question

Here is a list of systems focused on engineering question paper generation:

TestGen: A software that provides a library of engineering questions and enables users to generate custom exams and quizzes.

Description: TestGen is a software that provides a library of engineering questions and enables users to generate custom exams and quizzes.

Stats: TestGen is available on a one-time purchase basis and has a user-friendly interface.

Pros:

- Offers a large library of engineering questions
- Can be used to create exams, quizzes, and other assessments
- Provides efficient exam management
- Can save time compared to manual question preparation

Cons:

- May have limited customization options
- May require an internet connection

eEngineeringExam: A web-based platform that provides a library of engineering questions and enables users to generate custom exams and quizzes.

Description: eEngineeringExam is a web-based platform that provides a library of engineering questions and enables users to generate custom exams and quizzes.

Stats: eEngineeringExam is available on a subscription basis and has a user-friendly interface.

Pros:

- Offers a large library of engineering questions
- Can be used to create exams, quizzes, and other assessments
- Provides efficient exam management
- Can save time compared to manual question preparation

Cons:

- May have limited customization options
- May require an internet connection

IV. LITERATURE SURVEY

Various work has been done to automate the question generation and with The explosive advancement in the field of Artificial Intelligence, Expert Systems and Natural Language Processing provides a platform in which an effective system for the automation of scoring the content can be done efficiently.

♦"A Survey of Automated Question Generation Approaches and Systems" by Omid Mohamadinejad and W. Lewis Johnson, published in the Journal of Educational Technology Development and Exchange in 2018.

♦"Automated Question Generation for Online Learning: A Literature Review" by Wei-Ting Hsu, Yin-Leng Theng, and Sin-Wai Chan, published in the International Journal of Emerging Technologies in Learning in 2016.

♦"Automated Question Generation for Educational Assessment: A Review" by B. Y. Lee, Y. K. Tan, and B. H. Chia, published in the Journal of Educational Technology Development and Exchange in 2013.

♦"Automated Question Generation in E-Learning: A Review" by K. A. Mani and P. S. Kumar, published in the International Journal of Emerging Technologies in Learning in 2012.

♦"A Survey of Automated Question Generation Techniques" by H. Zhang, X. Hu, and J. Liu, published in the International Journal of Artificial Intelligence in Education in 2011.

♦"Automated Question Paper Generation Using Ontology-Based Approach" by B. Akila and R. Kavitha. This paper proposes an approach to automated question paper generation using an ontology-based model to represent domain knowledge.

♦"Automated Question Paper Generation using Natural Language Processing" by S. Sharma and A. Gupta. This paper describes a system that uses natural language processing techniques to automatically generate question papers.

♦"Design and Implementation of an Automated Question Paper Generation System" by P. Nandhini and R. Karthikeyan. This paper presents a system that uses rule-based algorithms to generate question papers based on user inputs.

♦"A Review of Automated Question Paper Generation Techniques" by A. Singh and S. Singh. This paper provides an overview of different automated question paper generation techniques, including rule-based approaches, machine learning approaches, and natural language processing techniques.

♦"Automated Question Generation using Semantic Networks" by S. Maheswari and R. Nallusamy. This paper proposes an approach to automated question generation using semantic networks to represent domain knowledge.

Overall, the literature on automated question paper generators suggests that they have the potential to be a useful tool for educators and instructors, but that further research is needed to improve the quality and effectiveness of these systems.These papers provide an overview of the state of the art in automated question generation and may provide valuable insights into different approaches and systems.

V. LIMITATIONS OF EXISTING SYSTEMS

Traditional question paper generation methods have several limitations, including:

►Time-consuming: The manual process of selecting, organizing and arranging questions is time-consuming and labour-intensive.

►Human error: The possibility of human error and biases in the selection of questions, leading to unfair and imbalanced examination papers.

►Limited diversity: The manual selection process often results in a limited diversity of questions, making it difficult to test a wide range of student abilities.

►Lack of customization: The manual process does not provide options for customization, making it difficult to fit the specific requirements of an exam.

►Inefficient: The manual process is often inefficient, leading to a higher likelihood of errors and inconsistencies in the examination paper.

VI. Need for Automated Question Paper Generation

The need for an automatic question paper generator arises from the need to simplify and streamline the process of creating examination papers. Some of the key benefits include:

►Time-saving: The manual process of creating examination papers can be time-consuming and labour-intensive. An automatic question paper generator eliminates the need for manual selection and arrangement of questions, saving time and effort.

►Increased fairness and diversity: An automatic question paper generator reduces the possibility of human biases and error in selecting questions, thereby increasing fairness and diversity in the examination paper.

►Customization: An automatic question paper generator provides options for customization, allowing the user to specify the type and number of questions, difficulty level, and other criteria, ensuring that the generated paper fits the specific requirements of the exam.

►Improved accuracy: An automatic question paper generator reduces the possibility of human error and ensures that the generated paper adheres to specified criteria, improving the overall accuracy of the examination paper.

VII. Development & Deployment

AQPG is a system developed with the objective of being versatile with provisions to suite the requirement of any educational organization with complete freedom. To achieve this, the system design is grounded on different evaluation levels built on the basic Blooms Taxonomy Learning Levels. The levels defined may vary according to the requirement of the varied educational institutions. Being developed in an engineering institution we have defined levels that would be apt and serve all the engineering institutions.

Based on the Learning Levels defined in the bloom's taxonomy, we are provided with a metric level at which the outcome is obtained. While the Blooms' taxonomy provides us with the basic metric it can be combined to form different metrics of measuring the outcomes achieved. In the context of an automatic question paper generator, the cognitive and sub-cognitive levels can be defined as follows:

Cognitive Level: The cognitive level refers to the level of thinking and understanding required to answer a question. In the case of an automatic question paper generator, this level can be used to classify the difficulty of the questions generated. For example, questions that require basic recall or recognition of information may be at a lower cognitive level, while questions that require higher order thinking skills such as analysis, synthesis, and evaluation may be at a higher cognitive level.

In the system designed we have defined Cognitive levels based on the graduate attributes and the subjects that are offered in the engineering curriculum. To ensure that we have questions evaluating students on every level of the Bloom's Taxonomy and to maintain the consistency of the weightage given to the modules and chapters in the syllabus we split the cognitive levels to different levels described below:

Foundation: Exhibit memory of previously learned material by recalling facts, terms, basic concepts, and answers

Comprehension: Construct meaning from instructional messages, including oral, written, and graphic communication by organizing of facts and ideas comparing, translating, interpreting, giving, descriptions, and stating main ideas.

Application: Solve problems to new and complex situations by applying the acquired knowledge, facts, techniques, and rules with out-of-the box thinking in different ways.

Analytical: Examine and break information into parts by identifying motives or causes. Make inferences and find evidence to support generalizations.

Sub-Cognitive Level: The sub-cognitive level refers to the level of mental processing that is required to answer a question. This level is more granular than the cognitive level and can be used to further refine the difficulty of the questions generated. For example, questions that require simple matching or identification of information may be at a lower sub-cognitive level, while questions that require complex reasoning or problem-solving may be considered to be at a higher sub-cognitive level.

Sub-cognitive levels with relevance to the field of engineering were defined and structured to ensure that the student' reasoning ability and intellect is developed and measured. The sub-cognitive levels defined gave the means to measure the aspect of the outcomes defined is attained and thus ensuring continuous improvement and change in the syllabus and bridging the gap between the curriculum and the industry. The different sub-cognitive levels defined are as shown below:

Engineering Aspect: The questions in this sub-cognitive level would measure if the graduate attributes and the outcomes of the course relevant to the Fundamental engineering concepts.

Industry Aspect: The questions framed under this type would evaluate the student on their understanding of the latest trends in the industry and the concurrent skills practiced in the industry.

Research Aspect: The questions categorized under this type would evaluate the student's ability to frame research relevant problems and propose suitable solutions.

Technology Aspect: These questions categorized under this type is intended to evaluate the students based on the technologies that fall under the specified subject domain and ensure ease of use.

By considering the varied levels upon which the questions are generated, the automatic question paper generator creates a balance in the toughness and ensures appropriately challenging set of questions for

a given topic or subject is framed.

Map-Reduce w.r.t BT: Mapping of the levels defined above to the Blooms Taxonomy levels is to ensure that the questions generated are mapped to relevant learning levels and are framed to ensure that the attainment of the subjects are measurable and aligned to the outcome based education model. This is done by mapping of relevant keywords under every Blooms Taxonomy level to the Sub-Cognitive Levels that is defined. This is done to map, refine and to reduce the combinations of keywords that is used to frame a question and gives us with a resulting better mapped and structured question paper.

Proposed Model: With the scope of generating a question paper for the engineering subjects we in this paper propose a model that would combine the above discussed cognitive and sub-cognitive levels and map the same to the keywords of the relevant subject and the

♦ **Input:** The user (Teacher) will input the subjective keywords and make selection for respective bloom taxonomy learning levels. The teacher will also provide with particulars about the paper viz marks, distribution, and other demographic information.

♦**Processing:** The designed system will concatenate the inputs given by the user in context to the learning levels, cognitive levels and sub-cognitive level as mentioned. The map-reduce algorithm enlists the relevant action verb to add to the significance of the framed questions

♦**Output:** After the particulars are fed and processed the paper is generated in the said format. The question paper generated has a fair mapping of all modules and a significant trade off between learning levels and the subjective topics

fig 7: -Analysis of Question Paper

VIII. CONCLUSION

The proposed Automatic question paper generator is a software tool that uses subjective keyword and bloom taxonomy learning levels to automatically generate question papers for assessments or exams. The use of such a tool can save a significant amount of time and effort for teachers and educational institutions, as well as provide a standardized and objective way of generating questions.

There are several advantages of using an automatic question paper generator. Firstly, it can ensure that the questions are well-balanced and cover a range of topics and difficulty levels. Secondly, it can reduce the potential for bias or subjectivity in question selection. Thirdly, it can save teachers and educational institutions time and effort in creating question papers. However, there are also some limitations and potential drawbacks of using automatic question paper generators. For example, these tools may not be able to generate questions that are tailored to the specific needs or learning objectives of a particular course or group of students. Additionally, there is a risk that the generated questions may not be of high quality or relevance, and may require further editing or revision by teachers.

Overall, while automatic question paper generators have the potential to be a useful tool for teachers and educational institutions, it is important to carefully evaluate their effectiveness and suitability for a particular context before using them

IX. FUTURE SCOPE

The future scope of automated question paper generation is vast and promising, as advancements in artificial intelligence and natural language processing continue to improve the capabilities of these systems. Some potential areas of growth and development for automated question paper generators include:

Personalization: As AI technologies continue to develop, automated question paper generators could become more personalized to individual students, taking into account their learning styles, strengths, and weaknesses.

Adaptive testing: Adaptive testing is a technique that tailors the difficulty of questions to the ability level of the test-taker, and automated question paper generators could be used to create adaptive tests that adjust the difficulty of questions based on the test-taker's responses.

Integration with learning management systems: Automated question paper generators could be integrated with learning management systems, allowing educators to easily create and administer tests online.

Multi-modal question generation: With the development of multimedia technologies, automated question paper generators could potentially generate questions that include multimedia components such as images, videos, and audio.

Natural language understanding: Natural language processing techniques could be used to enhance the ability of automated question paper generators to understand and generate questions in more natural, human-like language.

Overall, the future scope of automated question paper generation is vast and promising, with the potential to transform the way educators create and administer tests, and to improve the overall learning experience for students

Mobile Apps And Financial Decision Making

Manas Agrawal,Pranav Raorane,Keval Waghate

Abstract- **We exploit the release of a mobile application for a financial aggregation platform to analyse how technology adoption changes consumer financial decision making. We will use individual, transaction-level data from a financial aggregation platform. The platform allows users to link all their checking, savings, and credit card accounts, and view all spending, income transactions, and account balances in one place. A considerable fraction of adults uses this service and the user population appears to be representative of the overall population. The app reduced the cost of accessing personal financial information, and we find that this led to a drop in non-sufficient fund fees. Because of the manner in which these fees are incurred, this represents an unambiguous welfare improvement for users of the platform. The leading explanation for this result appears to be mistake avoidance due to easier access to information.**

I. INTRODUCTION:

In today's fast-paced and constantly evolving financial landscape, mobile apps provide individuals and businesses with the ability to monitor their finances and make informed decisions, at any time and from anywhere. This not only saves time but also reduces the complexity and stress associated with financial decision making.

In addition to providing basic financial management tools, many mobile apps offer advanced features such as real-time market updates, automated investment portfolios, and even access to professional financial advisors. These innovative solutions can help users stay ahead of the curve and make well-informed financial decisions that align with their goals and preferences.

Another benefit of mobile apps is that they provide a wealth of educational resources to help users improve their financial literacy and understanding of various financial concepts and products. This empowers users to make better decisions and take control of their finances, leading to greater financial security and independence.

Overall, the availability of mobile apps has made financial decision making more accessible, convenient, and effective for individuals and businesses alike. Whether you are looking to manage your daily finances, invest for the future, or achieve financial stability, there is a mobile app that can help.

II. Methodology:

To learn about financial growth and usage of mobile application we studied various case studies which can help to analyse the finical decision via mobile application.

Online payment has seen significant growth in India over the past few years, driven by factors such as increasing internet penetration, the proliferation of smartphones, and the government's push towards a cashless economy.

III. Implementation:

The ubiquity of mobile phones and availability of apps has changed the way people take financial decisions in India. Mobile apps provide convenient access to financial services and give users control over their financial decisions.

The Indian government has actively encouraged mobile based financial services as part of its 'Digital India' initiative. As of 2020, there are more than 500 mobile apps offering different types of financial services, ranging from banking services to stock trading. These apps have become popular among users due to their convenience and user-friendly features. Users can also compare various products and services to make a better financial decision.

Government initiatives such as 'Digital India' have also encouraged the use of mobile apps for financial decision making. The government has initiated several programs to encourage people to use mobile apps and digital banking services. This includes educating people about digital banking services and providing incentives for using mobile banking services.

IV. Data and Summary Analytics:

The launch of the Unified Payments Interface (UPI) in 2016 has been one of the main factors in the expansion of online payments in India. With the help of a mobile device and UPI, consumers can instantly transfer money across bank accounts. It has gained a lot of consumer and business support and is now the most extensively used digital payment option in India.

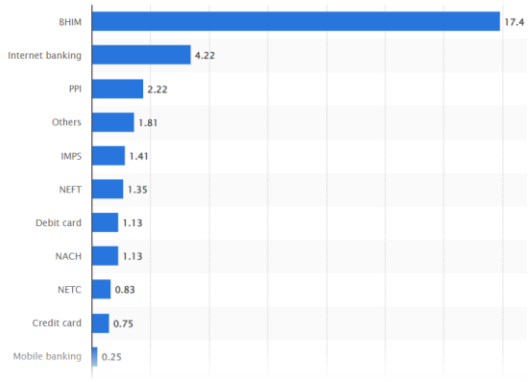
Along with debit and credit cards, other common online payment options in India include e-wallets like Paytm, PhonePe, and Google Pay. Due to their practicality and use, these payment options have become more and more popular.

The COVID-19 pandemic has also speed up the adoption of online payment in India as more people have opted to avoid physical touch by using digital payment methods.

In India, there were 4.7 billion total digital payment transactions in December 2020, up from 3.6 billion in the same month the year before, according to a study by the Reserve Bank of India. Also, from INR 15.2 trillion (about USD 206 billion) in December 2019 to

INR 31.4 trillion (around USD 425 billion) in December 2020, the overall value of digital payment transactions grew.

Volume of digital transactions in India in financial year 2023, by mode*(in billions)*



V. Conclusion:

Overall, the availability of mobile apps has made financial decision making more accessible, convenient, and effective for individuals and businesses alike. Whether you are looking to manage your daily finances, invest for the future, or achieve financial stability, there is a mobile app that can help. Apps help users to make wise decisions about their overall financial health. They can also be used as a tool for research and discovery, providing users with detailed information about investments, markets, and trends. This makes the process of financial decision making much faster and more efficient. In this way, mobile apps can provide a comprehensive view of the financial landscape, giving users the tools they need to make smart decisions.

Cybersecurity- Incident Response and Disaster Recovery Planning

Vedant Pathak, Piyush Kumar,Ujjwal Thakur

Abstract- **This technical research paper explores thecritical aspects of cybersecurity incident response and disaster recovery planning. The paper delves into the various types of cybersecurity incidents, their potential impact, and the steps involved inresponding to them. It also discusses the importance of having a disaster recovery plan in place, which involves identifying critical systems, data, and applications, and defining procedures for restoring them in the event of a disruption. The paper highlights the key components of a successful incident response plan, including risk assessment, incident identification, containment, analysis, and recovery. The authors provide insights into the current trends and best practices in the field of cybersecurity incident response and disaster recovery planning, along with recommendations for organizations looking to improve their preparedness in these critical areas. Ultimately, the paper emphasizes the importance of having a comprehensive and well-defined incident response and disaster recovery plan in place, as it can significantly mitigate the impact of cybersecurity incidents and ensure business continuity.**

Keywords- Machine Learning, Deep Learning Convolutional Neural Networks, Computer Vision, Sign Language.

INTRODUCTION

In today's digital age, cybersecurity incidents have become a significant threat to organizations of all sizes and industries. With the increasing sophistication of cyberattacks and the growing reliance on technology, the potential impact of these incidents can be severe, ranging from financial losses to reputational damage and legal liabilities. As a result, it is critical for organizations to have a well-defined incident response and disaster recovery plan in place to minimize the impact of such incidents and ensure business continuity.

This technical research paper aims to provide an in-depth analysis of incident response and disaster recovery planning in the context of cybersecurity. The paper explores the various types of cybersecurity incidents, their potential impact on organizations, and the critical steps involved in responding to them. The authors also discuss the importance of having a disaster recovery plan in place, which involves identifying critical systems, data, and applications, and defining procedures for restoring them in the event of a disruption.

The paper further highlights the key components of a successful incident response plan, including risk assessment, incident identification, containment, analysis, and recovery. It provides insights into the current trends and best practices in the field of incident response and disaster recovery planning, along with practical recommendations fororganizations looking to improve their preparednessin these critical areas.

LITERATURE SURVEY

In recent years, there has been an increasing focus on incident response and disaster recovery planningin the field of cybersecurity. Numerous studies have highlighted the importance of having a well-defined incident response plan to minimize the impact of cybersecurity incidents and ensure business continuity. For instance, a study by Ponemon Institute (2019) found that organizations with a mature incident response plan in place were able to detect and contain cybersecurity incidents more quickly, resulting in lower costs and faster recoverytimes.

Similarly, research by the Disaster Recovery Preparedness Council (2018) emphasized the need for organizations to have a disaster recovery plan inplace to ensure the continuity of critical business functions in the event of a disruption. The study found that organizations with a well-defined disaster recovery plan were able to recover from disruptions more quickly and with fewer negative consequences than those without a plan.

In addition, various industry frameworks, such as the National Institute of Standards and Technology (NIST) Cybersecurity Framework and the Payment Card Industry Data Security Standard (PCI DSS), have highlighted the importance of incident response and disaster recovery planning as critical components of a comprehensive cybersecurity strategy.

I- VISION AND GOALS

The vision and goals of this technical research paperon incident response and disaster recovery planning for cybersecurity are to provide insights into the critical aspects of incident response and disaster recovery planning, including their impact on organizations, the key components of a successful plan, and best practices for implementation. The paper aims to highlight the importance of proactive planning and preparedness in minimizing the impact of cybersecurity incidents and ensuring business continuity. Ultimately, the goal of this paper is to provide practical recommendations and insights that can help organizations improve their incidentresponse and disaster recovery capabilities and mitigate the risks associated with cyber threats..

II- METHODOLOGY

The methodology for this technical research paper on incident response and disaster recovery planning for cybersecurity involves a comprehensive review of the existing literature on the topic. The review is based on a systematic search of relevant academic journals, industry reports, and other authoritative sources. The search is conducted using keywords related to incident response and disaster recovery planning, cybersecurity incidents, risk assessment, and business continuity.

The sources identified through the search are evaluated based on their relevance, quality, and applicability to the topic. The data extracted from the sources are analyzed using a qualitative approach to identify key themes, concepts, and best practices related to incident response and disaster recovery planning.

The research also involves case studies of organizations that have implemented successful Bincident response and disaster recovery plans. These case studies provide valuable insights into the practical application of incident response and disaster recovery planning, including the challenges faced and the strategies employed to overcome them.

III- LIMITATIONS

There are several limitations to this technical research paper on incident response and disaster recovery planning for cybersecurity. One of the primary limitations is the scope of the study. While the paper provides a comprehensive review of the literature and includes case studies and expert interviews, it cannot cover every aspect of incident response and disaster recovery planning. There may be specific nuances or approaches that are not covered in this paper.

Another limitation is the potential for bias in the sources used. The sources identified through the systematic search may not provide a complete picture of incident response and disaster recovery planning, and there may be variations in the quality and applicability of the sources.

Furthermore, the research is based on current knowledge and practices in incident response and disaster recovery planning, which may evolve over time. New threats, emerging technologies, and changing regulatory requirements may require organizations to adjust their incident response and disaster recovery plans to ensure continued effectiveness.

Finally, the research is limited to the information that is publicly available. Some organizations may have proprietary information related to their incident response and disaster recovery plans, which may notbe accessible to the public.

There are several limitations to this technical research paper on incident response and disaster recovery planning for cybersecurity. One of the primary limitations is the scope of the study. While the paper provides a comprehensive review of the literature and includes case studies and expert interviews, it cannot cover every aspect of incident response and disaster recovery planning. There may be specific nuances or approaches that are not covered in this paper.

IV- CONCLUSION

In conclusion, this technical research paper has highlighted the importance of incident response and disaster recovery planning in the field ofcybersecurity. The paper provides a comprehensive

review of the literature, including case studies and expert interviews, to identify key themes, concepts, and best practices related to incident response and disaster recovery planning.

The paper emphasizes the need for organizations to take a proactive approach to cybersecurity by developing and implementing robust incident response and disaster recovery plans. Such plans can help organizations minimize the impact of cybersecurity incidents and ensure business continuity.

While there are limitations to this research, including the scope of the study and the potential for bias in the sources used, the paper provides valuable insights into incident response and disaster recovery planning for cybersecurity. The findings of this research can be used by organizations to improve their incident response and disaster recovery capabilities and mitigate the risks associated with cyber threats.

Overall, incident response and disaster recovery planning are critical components of a comprehensive cybersecurity strategy. Organizations that invest in developing and implementing robust incident response and disaster recovery plans are better positioned to detect and contain cybersecurity incidents, minimize the impact of such incidents, and ensure business continuity.

Digital Sensor Representation in Real-Time Applications Using a Hybrid Approach

Amit Tiwari
Thakur College of Engineering & Technology Mumbai
amit.tiwari@tcetmumbai.in

Abstract- **We propose a hybrid approach for peripheral device emulation of sensors on hardware platforms as well as hardware virtualization platforms. The proposed approach stems from challenges faced in IoT (Internet of Things) application development, namely, hardware selection and evaluation, software development for the hardware under consideration, and reliable reproducibility of application tests. The hybrid approach provides strong support for all development phases of IoT products and system development in the absence of physical peripheral sensor hardware. We also present an event-driven software architecture for different components and a modular workflow for implementing the emulator. Within the approach, a peripheral device emulator is conceivable by using the event-driven software architecture and modular workflow. Finally, we introduce the term Simulatable Datasheet, which is realizable by configuring the emulator as per technical documentation like datasheets or application notes. The Simulatable Datasheet provides an interactive interface to improve decision-making during the product development phase. The Simulatable Datasheet thus relaxes the need for hardware availability and eases testing scenarios during IoT real and non-real-time application development without modification in the firmware. Additionally, these datasheets can reduce efforts for hardware and software integration and enable faster debugging, which in turn reduces the overall time to deploy IoT applications in various fields.**

Keywords— Internet of Things (IoT), emulation, simulation, peripheral device emulation, simulatable datasheet, sensors.

I. INTRODUCTION

The IoT has significant potential in enhancing and influencing growth in many sectors such as manufacturing, health, consumer electronics, education, to name a few. Bringing the IoT to sector-specific components opens up the possibility for data-driven decision strategy in business using ubiquitous information obtained from a plethora of heterogeneous devices and systems [1], thus instigating many public and proprietary organizations to invest their resources in IoT research, system development, platforms, and frameworks. A few aspects addressed by these frameworks and platforms are effective utilization of limited hardware resources, interoperability at software, hardware and system-level, scalability, flexibility, real-time and deterministic behavior at application level [1,2,3]. These aspects make IoT solutions challenging in terms of design, development, and testing. Typical IoT solutions involve multi-level, complex architectures stemming from firmware to the high-level application [1]. Thus, the typical IoT development leans towards an agile software development approach where development and testing are performed incrementally [4].

Text-dependent recognition is when the text for enrolment and recognition must be the same. Individuals present a predefined password or "prompted phrase" that is programmed into the system in a text dependent voice recognition system, which can increase performance, especially with cooperative users. Prompts might be generic or specific to each speaker. Text-agnostic technologies don't compare what was spoken at the time of registration and recognition. In circumstances where the speaker is not cooperative, the text independent system has no prior knowledge of the presenter's phrase and is far more adaptable. There are two main uses of speaker recognition: verification and authentication. Verification or authentication occurs when a speaker claims to be of a particular identity and the voice is used to validate that claim.

1.1 challenges

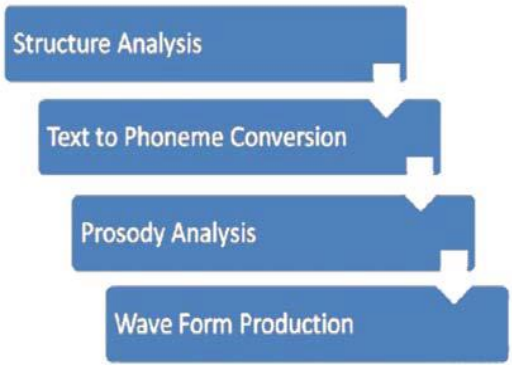

Fig. 1. Speech Synthesis [2]

The speaker's voice is recorded during enrolment, and a number of features are extracted to create a data set or template. In the second phase, a voice sample or utterance is compared to a template that has already been constructed. In identification systems, the utterance is compared to several templates to determine the best match, but in verification systems, the utterance is compared to a single template specific to the speaker being verified. Verification is faster than identification because of the process involved. We offer machine learning techniques for speaker recognition, in which the extracted feature values are used to train selected ML algorithms, and the learned model is then utilised to recognise a given speaker.

Concatenating fragments of recorded speech kept in a database can be used to create synthesised speech. The size of the stored speech units varies by system; a system that stores phones or diphones has the greatest output range, but may lack clarity. A simple solution could be to remove the barrier to contact. A simple option could be to use spoken language that a computer can understand to bridge the communication gap. Although significant progress has been achieved in this field, such systems still face issues like as limited vocabulary or complex syntax, as well as the difficulty of retraining the system in varied situations for different speakers.

The storing of full words or sentences allows for high-quality output in specific situations. Alternatively, a

synthesiser can create totally synthetic voice output by incorporating a model of the vocal tract and other human voice features. TTS (text-to-speech) is an assistive device that reads digital text out loud. It's also known as read-aloud technology. TTS may translate words on a computer or other digital device into audio with the click of a button or the touch of a finger. A simple solution could be to remove the barrier to contact. A simple option could be to use spoken language that a computer can understand to bridge the communication gap.

The detection of emotion in speech is particularly beneficial for applications that demand natural human–machine interaction, such as web videos and computer demonstration apps, because the system's reaction to the user is dependent on sensed emotion. Voice (e.g., "call home"), call routing (e.g., "I'd like to make a collect call"), home appliance control, keyword search (e.g., locating a podcast where specific words are spoken), basic data entry (e.g., entering a credit card number), formal document preparation (e.g., creating a radiology report), and defining organisms (usually called direct voice input, where specific words are spoken) are all examples of speech recognition.

The ability of the brain to utilise and understand visual information is referred to as visual processing. The conversion of light energy into a meaningful image is a complicated process aided by a variety of brain regions and higher-level cognitive processes. Advances in speech- and visual-processing systems have permitted significant research and progress in the areas of human–computer interfaces, biometric applications, security and surveillance, and, most recently, computational behavioural analysis. Although standard machine learning and evolutionary calculations have enhanced Information System for decades to address complex pattern recognition problems, these methods have limitations when dealing with natural data or images in raw data formats. Before deploying machine learning models to extract representative features from raw data or images, a number of computational procedures are used.

1) Terminology for Speech Recognition:

Speech recognition is a technique that allows a device to capture the words uttered into a microphone by a human. These words are then analysed by speech recognition, with the system eventually producing recognised words. The speech recognition method is divided into several parts, each of which is detailed in detail in the following sections [6]. Speech translation is significant because it allows speakers from all over the world to communicate in their native tongues, eliminating the language barrier in global commerce and cross-cultural interactions. The achievement of universal voice translation would be of enormous scientific, cultural, and economic significance for humanity. Our project eliminates the language barrier, allowing people to communicate in their preferred language. The ability to hear the spoken word is a desirable condition in the speech recognition process. The recognition engine takes into account all of a person's words, but in practise, the efficiency of the speech recognition engine is determined by a number of factors. Terminology, concurrent users, and noisy settings are the primary variables that are counted as dependent variables for a speech recognition engine.

2) Speech Recognition Process

Translation is the process of conveying meaning from one language (the source) to another (the target). Speech synthesis is employed primarily for two reasons. Dictation, first and foremost, is the conversion of spoken words into text via speech processing, and device control, second, is the development of software that allows a person to operate numerous voice apps [3]. Through microphone input, the PC sound card generates the matching digital representation of incoming sounds. Digitization is the process of converting an analogue signal to a digital format. Quantization is described as the procedure of approximating a continuous set of values. Sampling converts a continuous signal into a discrete signal.

Attention models are neural network input processing strategies that allow the network to focus on specific features of complex input one by one until the entire dataset has been categorised. The idea is to break down difficult activities into smaller, sequentially processed areas of attention. In broad strokes, an attention model is a function that maps a query and a "s set" of key–value pairs to an output, with the query, keys, values, and final output all being vectors. The result is a weighted sum of the values, with the weight assigned to each value determined by the query's compatibility function with the relevant key–value pair.

3) Neural Machine Translation:

This machine translation technique is used in artificial neural networks to forecast the probability of a set of phrases, which is commonly done in a single integrated model that models full sentences. In recent years, neural network technology has been employed to tackle problems in a variety of ways. In the natural speech processing area, the use of neural machine translation (NMT) is a example of this.

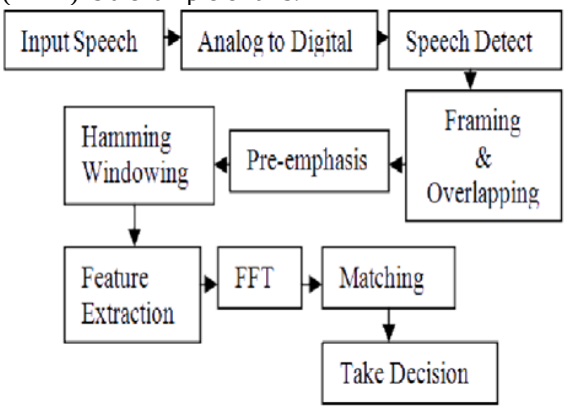

Fig. 2. Recognition Process

The missing translation is a phenomenon in which text that was there in the source is absent in terms of context or word translation. The use of a neural network to learn a mathematical model for NMT is known as neural machine translation. The methodology's main advantage is that it allows a single framework to be trained directly on both the source and destination text, eliminating the need for a statistical machine learning pipeline of complex systems [5].

- **Linked Words or Connected Speech**: Linked words or connected speech are identical to independent speech, and they make separate utterances except for minor lags between them.
- **Continuous Speech:** Also known as computer dictation, continuous speech allows the user to talk nearly naturally.
- **spontaneous speech:** At its most basic level, spontaneous speech can be defined as speech that sounds natural and is not rehearsed. Random speech capabilities of an ASR device should be able to accept a variety of natural speech qualities, such as phrases that run together, "ums" and "ahs," and even mild stutters.

In most cases, machine translation models entire phrases by using an artificial neural network to predict a series of terms. Typically, it uses an artificial neural network to anticipate the sequence of words to model full sentences in a single integrated model. A recurrent neural network is typically used to model word sequences at first (RNN). Unlike traditional phrase-based translation, which uses numerous small subcomponents that must be tweaked separately, neural machine translation uses a single, large neural network to read a phrase and output the correct translation. Because just one model is required for translation, neural machine translation via end-to-end systems is referred to as a neural machine translation system.

Today, translation is more common and accessible than it has ever been. Organizations with greater budgets may engage a translation company or independent professional translators to handle all of their translation needs; organizations with smaller budgets, or dealing with subjects unfamiliar to many translators, may combine the services of professional translators.

II. Literature Review

According to Mehmet Berkehan Akçay et al. [1], neural networks are primarily used in industrial control and robotics applications. Recent advances in neural networks have aided successful IS implementations in almost every aspect of human life, including intelligent travel, intelligent diagnosis and health monitoring for precision medicine, robotics and home appliance automation, virtual online support, e-marketing, weather forecasting, and natural disaster management, among others.

G. Tsontzos et al. [2] highlighted how feelings help us understand each other better, and a natural extension of this understanding is to include computers. Speech recognition is becoming a part of our daily lives, thanks to smart mobile gadgets that can take and reply to voice instructions with synthesised speech. Speech emotion recognition (SER) could be utilised to allow machines to identify our feelings.

T. Taleb et al. [7] were prompted by the realisation that these requirements set stricter limits on the amount of progress that may be accomplished when utilising HMMs in voice recognition. New modelling approaches that explicitly model time are being studied in an attempt to increase robustness, particularly under noisy settings, and this study was partially sponsored by the EU-IST FP6 HIWIRE research project. The

use of spatial similarities, such as dynamic linear models (LDM), in voice recognition was first proposed.

Learning speech, according to Vincius Maran et al. [6], is a dynamic system in which the infant's processing of phonemes is defined by continuities and discontinuities on the way to advanced creation of ambient language segments and structures.

Y. Wu et al. [3] noted that discriminative testing has been used for speech recognition for many years now. The few organizations that have had the resources to implement discriminatory instructions for large-scale speech recognition assignments have mostly used the full shared information system in recent years (MMI). Instead, in the extension of the studies first presented, we reflect on the minimum classification error (MCE) paradigm for discriminatory instruction.

Peng et al. [4] stated that identification of speakers refers to identifying people by their voice. This technology is increasingly adopted and used as a kind of biometrics for its ease of use and non-interactivity, and soon became a research hotspot in the field of biometrics.

Shah Nawazuddin and Sinha [10] emphasized how the work presented was an extension of current acoustic model interpolation-based fast adaption methodologies. In these methods, the basis (model) weights are determined using an iterative procedure based on the maximum likelihood (ML) criterion.

There are various ways to understand feelings from expressiveness, according to Varghese et al. [5]. Many attempts have been made to use voice information to identify states. Some crucial voice function vectors have been chosen, in which utterance level statistics are measured, in order to interpret feelings.

A long-term goal, according to D.J. Atha et al. [9], is the invention of an automatic real-time translating system that uses voice as the source. Recent advancements in computational translation science, on the other hand, increase the likelihood of widespread implementation in the near future.

T. Lalith Kumar et al. suggested a speaker-dependent voice recognition system based on MLP and RNN in 2009 [11]. As a feature vector, linear prediction coefficients were utilized. The recognition accuracies of MLP are better than RNN, according to the accuracy levels attained during testing. We discovered that Mel frequency cepstral coefficients, linear predictive coefficients, linear predictive cepstral coefficients, linear spectral frequency, formants, and pitch have all been employed to characterize the speaker's voice [7].

A novel feature vector is proposed in this paper. Formant frequencies are the vocal tract's resonance frequencies, which vary depending on the speaker. Furthermore, fundamental frequency is an important feature of speech that establishes the signal's periodicity.

It has a low value for adult male speakers and a high value for female and child speakers. The fundamental frequency works reasonably well for speaker recognition when speech utterances are properly picked so that all of the frames in an utterance are voiced [16].

III. Proposed Method

The work in this study is based on the flowchart below. According to the speech working model. The models shown before contain millions of parameters from which the instruction corpus must be learned. Additional information, such as text that is closely related to the speech we are about to translate [7], is used when it is suitable. This text can be written in either the source or target language, or both.

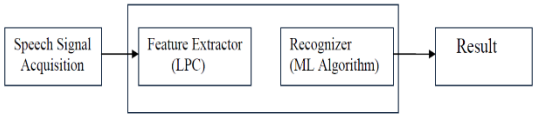

Fig. 3. Speaker Recognition

Future development will reach billions of smart phone users for the most complex intelligent systems focused on deep learning. There is a lengthy list of vision and voice technologies that can increasingly simplify and assist the visual and auditory processing of humans to a greater scale and consistency, from sensation and emotion detection to the development of self-driving autonomous transport systems. This paper serves scholars, clinicians, technology creators, and consumers as an exemplary analysis of emerging technologies in many fields, such as behavioural science, psychology, transportation, and medicine.

IV. Results

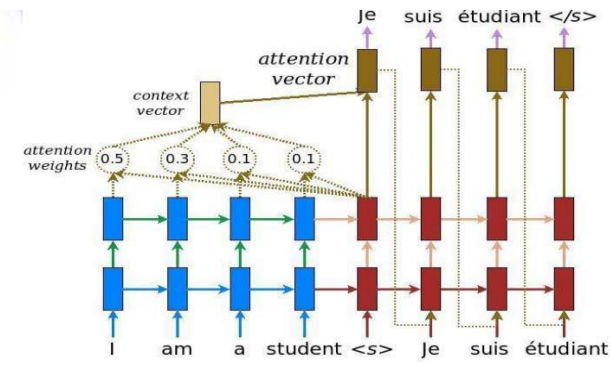

Fig. 4. The Attention Model

The use of multimodal vector sources of information and functionality was used to present speech detection with real-time predictive voice translation device optimization. The manner in which external information input is employed to strengthen the system's correctness, allowing a substantial improvement, when compared to natural processes, is the central production and dedication of this study. In addition, a new effort was launched and explored from an analytical approach while keeping realistic. According to our discussions and plans, the technology we desire transforms Hindi to English and vice versa.

4.1 Initial Test

The encoder–decoder model constraint of attention is presented to encrypt the input sequence to a single fixed length vector from which each output time stage is decoded. Focus is recommended as an approach for both aligning and interpreting long sequences, and this difficulty is thought to be more of a concern. The attention model creates a context vector that is filtered independently for each output time step, rather than storing the input sequence into a single fixed-context vector. The approach is extended to a machine translation problem, as it was to the encoder–decoder text, and GRU units are used instead of LSTM memory cells [9].

Facilitated communication (FC), or supported typing, is a scientifically discredited technique that attempts to aid communication by people with autism or other communication disabilities, and who are non-verbal. The facilitator guides the disabled person's arm or hand, and attempts to help them type on a keyboard or other device.

The calculations applied are:
FC= Totally Connected Layer (Dense)
Output EO=Encoder
H = Concealed State
X=Entry into the Decoder
And with the pseudo-code:

FC (tanh (FC(EO) + FC(H))) score =Weights for focus = SoftMax (score, axis = 1).

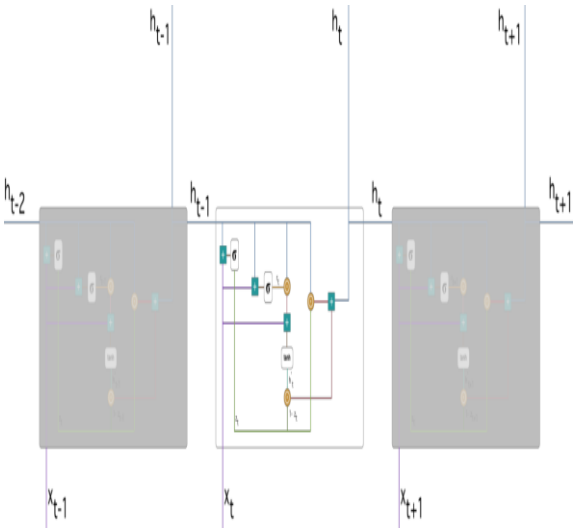

Fig. 5. First Translation from English to Hindi

It is implemented on the last axis by default, but we want to implement it on the first axis here, as the score form is as follows: batch size, max length, secret size. The length of our input is Max length. Since we are attempting to assign a weight to each input, it is important to add SoftMax on that axis. Context vector = sum (weights of focus * EO, axis = 1). The same explanation as above applies for an axis selection of 1. Embedding output = The input is transferred through an embedding layer to the decoder. Integrated vector = concept (embedding output, context vector).

4.2 Translate

The assessment function is similar to the teaching loop, with the exception that we do not put any pressure on teachers. The input to the decoder, as well as the hidden state and encoder output, are its past predictions at each time point. Predicting the final token as the model predicts is not a good idea. For each step-in time, keep track of the attention weights. A translator is a computer software that transforms one language to another using a programming language processor. It translates a program written in source code to machine code. During translation, it detects and identifies errors. It converts a high-level language program into a machine language program that can be understood by the central processing unit (CPU). It also checks for programme errors.

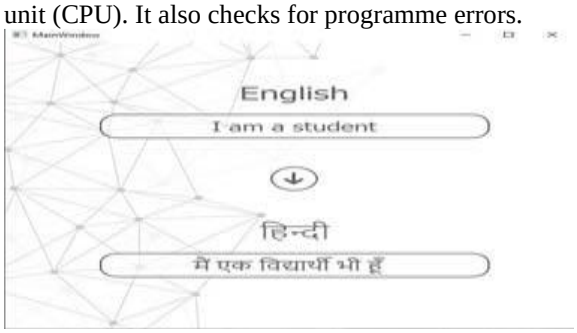

Fig. 6. Second Translation from English to Hindi

Fig. 7. Third Translation from English to Hindi

V. Conclusion

Speech recognition applications have become increasingly more complicated and precise during the last few years. This study delves into the most recent advances in intelligent vision and speech algorithms, as well as their applications on the most popular smart phones and embedded platforms, as well as their limits. Despite the enormous increases in success and efficacy made possible by deep learning algorithms, training the machine with other information sources, which is the framework, contributes significantly to the class subject.

VI. Future Scope

This work can be examined in greater detail in order to improve and add new features to the project, and it can be improved further. The new programme does not support a broad vocabulary in order to collect a larger number of samples and maximise productivity [10]. The current edition of the programme only protects a few parts of the notepad, but more places can be protected, and efforts will be made in this direction.

A simple option could be to use spoken language that a computer can understand to bridge the communication gap.

The detection of emotion in speech is particularly beneficial for applications that demand natural human–machine interaction, such as web videos and computer demonstration apps, because the system's reaction to the user is dependent on sensed emotion. Voice (e.g., "call home"), call routing (e.g., "I'd like to make a collect call"), home appliance control, keyword search (e.g., locating a podcast where specific words are spoken), basic data entry (e.g., entering a credit card number), formal document preparation (e.g., creating a radiology report), and defining organisms (usually called direct voice input, where specific words are spoken) are all examples of speech recognition.

The ability of the brain to utilise and understand visual information is referred to as visual processing. The conversion of light energy into a meaningful image is a complicated process aided by a variety of brain regions and higher-level cognitive processes. Advances in speech- and visual-processing systems have permitted significant research and progress in the areas of human–computer interfaces, biometric applications, security and surveillance, and, most recently, computational behavioural analysis. Although standard machine learning and evolutionary calculations have enhanced Information System for decades to address complex pattern recognition problems, these methods have limitations when dealing with natural data or images in raw data formats. Before deploying machine learning models to extract representative features from raw data or images, a number of computational procedures are used.

1) Terminology for Speech Recognition:

Speech recognition is a technique that allows a device to capture the words uttered into a microphone by a human. These words are then analysed by speech recognition, with the system eventually producing recognised words. The speech recognition method is divided into several parts, each of which is detailed in detail in the following sections [6]. Speech translation is significant because it allows speakers from all over the world to communicate in their native tongues, eliminating the language barrier in global commerce and cross-cultural interactions. The achievement of universal voice translation would be of enormous scientific, cultural, and economic significance for humanity. Our project eliminates the language barrier, allowing people to communicate in their preferred language. The ability to hear the spoken word is a desirable condition in the speech recognition process. The recognition engine takes into account all of a person's words, but in practise, the efficiency of the speech recognition engine is determined by a number of factors. Terminology, concurrent users, and noisy settings are the primary variables that are counted as dependent variables for a speech recognition engine.

2) Speech Recognition Process

Translation is the process of conveying meaning from one language (the source) to another (the target). Speech synthesis is employed primarily for two reasons. Dictation, first and foremost, is the conversion of spoken words into text via speech processing, and device control, second, is the development of software that allows a person to operate numerous voice apps [3]. Through microphone input, the PC sound card generates the matching digital representation of incoming sounds. Digitization is the process of converting an analogue signal to a digital format. Quantization is described as the procedure of approximating a continuous set of values. Sampling converts a continuous signal into a discrete signal.

Attention models are neural network input processing strategies that allow the network to focus on specific features of complex input one by one until the entire dataset has been categorised. The idea is to break down difficult activities into smaller, sequentially processed areas of attention. In broad strokes, an attention model is a function that maps a query and a "s set" of key–value pairs to an output, with the query, keys, values, and final output all being vectors. The result is a weighted sum of the values, with the weight assigned to each value determined by the query's compatibility function with the relevant key–value pair.

3) Neural Machine Translation:

This machine translation technique is used in artificial neural networks to forecast the probability of a set of phrases, which is commonly done in a single integrated model that models full sentences. In recent years, neural network technology has been employed to tackle problems in a variety of ways. In the natural speech processing area, the use of neural machine translation (NMT) is a example of this.

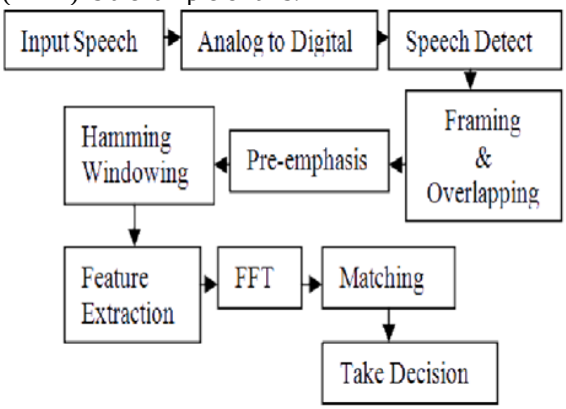

Fig. 2. Recognition Process

The missing translation is a phenomenon in which text that was there in the source is absent in terms of context or word translation. The use of a neural network to learn a mathematical model for NMT is known as neural machine translation. The methodology's main advantage is that it allows a single framework to be trained directly on both the source and destination text, eliminating the need for a statistical machine learning pipeline of complex systems [5].

- **Linked Words or Connected Speech**: Linked words or connected speech are identical to independent speech, and they make separate utterances except for minor lags between them.
- **Continuous Speech:** Also known as computer dictation, continuous speech allows the user to talk nearly naturally.
- **spontaneous speech:** At its most basic level, spontaneous speech can be defined as speech that sounds natural and is not rehearsed. Random speech capabilities of an ASR device should be able to accept a variety of natural speech qualities, such as phrases that run together, "ums" and "ahs," and even mild stutters.

In most cases, machine translation models entire phrases by using an artificial neural network to predict a series of terms. Typically, it uses an artificial neural network to anticipate the sequence of words to model full sentences in a single integrated model. A recurrent neural network is typically used to model word sequences at first (RNN). Unlike traditional phrase-based translation, which uses numerous small subcomponents that must be tweaked separately, neural machine translation uses a single, large neural network to read a phrase and output the correct translation. Because just one model is required for translation, neural machine translation via end-to-end systems is referred to as a neural machine translation system.

Today, translation is more common and accessible than it has ever been. Organizations with greater budgets may engage a translation company or independent professional translators to handle all of their translation needs; organizations with smaller budgets, or dealing with subjects unfamiliar to many translators, may combine the services of professional translators.

II. Literature Review

According to Mehmet Berkehan Akçay et al. [1], neural networks are primarily used in industrial control and robotics applications. Recent advances in neural networks have aided successful IS implementations in almost every aspect of human life, including intelligent travel, intelligent diagnosis and health monitoring for precision medicine, robotics and home appliance automation, virtual online support, e-marketing, weather forecasting, and natural disaster management, among others.

G. Tsontzos et al. [2] highlighted how feelings help us understand each other better, and a natural extension of this understanding is to include computers. Speech recognition is becoming a part of our daily lives, thanks to smart mobile gadgets that can take and reply to voice instructions with synthesised speech. Speech emotion recognition (SER) could be utilised to allow machines to identify our feelings.

T. Taleb et al. [7] were prompted by the realisation that these requirements set stricter limits on the amount of progress that may be accomplished when utilising HMMs in voice recognition. New modelling approaches that explicitly model time are being studied in an attempt to increase robustness, particularly under noisy settings, and this study was partially sponsored by the EU-IST FP6 HIWIRE research project. The

use of spatial similarities, such as dynamic linear models (LDM), in voice recognition was first proposed.

Learning speech, according to Vincius Maran et al. [6], is a dynamic system in which the infant's processing of phonemes is defined by continuities and discontinuities on the way to advanced creation of ambient language segments and structures.

Y. Wu et al. [3] noted that discriminative testing has been used for speech recognition for many years now. The few organizations that have had the resources to implement discriminatory instructions for large-scale speech recognition assignments have mostly used the full shared information system in recent years (MMI). Instead, in the extension of the studies first presented, we reflect on the minimum classification error (MCE) paradigm for discriminatory instruction.

Peng et al. [4] stated that identification of speakers refers to identifying people by their voice. This technology is increasingly adopted and used as a kind of biometrics for its ease of use and non-interactivity, and soon became a research hotspot in the field of biometrics.

Shah Nawazuddin and Sinha [10] emphasized how the work presented was an extension of current acoustic model interpolation-based fast adaption methodologies. In these methods, the basis (model) weights are determined using an iterative procedure based on the maximum likelihood (ML) criterion.

There are various ways to understand feelings from expressiveness, according to Varghese et al. [5]. Many attempts have been made to use voice information to identify states. Some crucial voice function vectors have been chosen, in which utterance level statistics are measured, in order to interpret feelings.

A long-term goal, according to D.J. Atha et al. [9], is the invention of an automatic real-time translating system that uses voice as the source. Recent advancements in computational translation science, on the other hand, increase the likelihood of widespread implementation in the near future.

T. Lalith Kumar et al. suggested a speaker-dependent voice recognition system based on MLP and RNN in 2009 [11]. As a feature vector, linear prediction coefficients were utilized. The recognition accuracies of MLP are better than RNN, according to the accuracy levels attained during testing. We discovered that Mel frequency cepstral coefficients, linear predictive coefficients, linear predictive cepstral coefficients, linear spectral frequency, formants, and pitch have all been employed to characterize the speaker's voice [7].

A novel feature vector is proposed in this paper. Formant frequencies are the vocal tract's resonance frequencies, which vary depending on the speaker. Furthermore, fundamental frequency is an important feature of speech that establishes the signal's periodicity.

It has a low value for adult male speakers and a high value for female and child speakers. The fundamental frequency works reasonably well for speaker recognition when speech utterances are properly picked so that all of the frames in an utterance are voiced [16].

III. Proposed Method

The work in this study is based on the flowchart below. According to the speech working model. The models shown before contain millions of parameters from which the instruction corpus must be learned. Additional information, such as text that is closely related to the speech we are about to translate [7], is used when it is suitable. This text can be written in either the source or target language, or both.

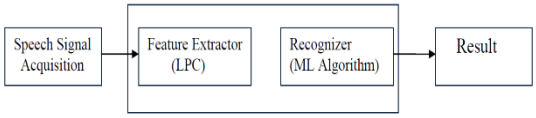

Fig. 3. Speaker Recognition

Future development will reach billions of smart phone users for the most complex intelligent systems focused on deep learning. There is a lengthy list of vision and voice technologies that can increasingly simplify and assist the visual and auditory processing of humans to a greater scale and consistency, from sensation and emotion detection to the development of self-driving autonomous transport systems. This paper serves scholars, clinicians, technology creators, and consumers as an exemplary analysis of emerging technologies in many fields, such as behavioural science, psychology, transportation, and medicine.

IV. Results

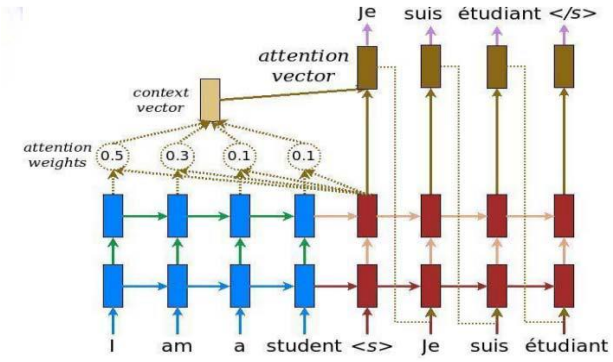

Fig. 4. The Attention Model

The use of multimodal vector sources of information and functionality was used to present speech detection with real-time predictive voice translation device optimization. The manner in which external information input is employed to strengthen the system's correctness, allowing a substantial improvement, when compared to natural processes, is the central production and dedication of this study. In addition, a new effort was launched and explored from an analytical approach while keeping realistic. According to our discussions and plans, the technology we desire transforms Hindi to English and vice versa.

4.1 Initial Test

The encoder–decoder model constraint of attention is presented to encrypt the input sequence to a single fixed length vector from which each output time stage is decoded. Focus is recommended as an approach for both aligning and interpreting long sequences, and this difficulty is thought to be more of a concern. The attention model creates a context vector that is filtered independently for each output time step, rather than storing the input sequence into a single fixed-context vector. The approach is extended to a machine translation problem, as it was to the encoder–decoder text, and GRU units are used instead of LSTM memory cells [9].

Facilitated communication (FC), or supported typing, is a scientifically discredited technique that attempts to aid communication by people with autism or other communication disabilities, and who are non-verbal. The facilitator guides the disabled person's arm or hand, and attempts to help them type on a keyboard or other device.

The calculations applied are:
FC= Totally Connected Layer (Dense)
Output EO=Encoder
H = Concealed State
X=Entry into the Decoder
And with the pseudo-code:

FC (tanh (FC(EO) + FC(H))) score =Weights for focus = SoftMax (score, axis = 1).

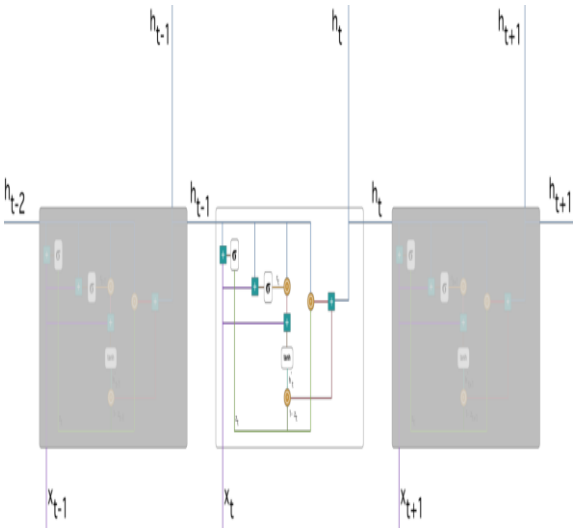

Fig. 5. First Translation from English to Hindi

It is implemented on the last axis by default, but we want to implement it on the first axis here, as the score form is as follows: batch size, max length, secret size. The length of our input is Max length. Since we are attempting to assign a weight to each input, it is important to add SoftMax on that axis. Context vector = sum (weights of focus * EO, axis = 1). The same explanation as above applies for an axis selection of 1. Embedding output = The input is transferred through an embedding layer to the decoder. Integrated vector = concept (embedding output, context vector).

4.2 Translate

The assessment function is similar to the teaching loop, with the exception that we do not put any pressure on teachers. The input to the decoder, as well as the hidden state and encoder output, are its past predictions at each time point. Predicting the final token as the model predicts is not a good idea. For each step-in time, keep track of the attention weights. A translator is a computer software that transforms one language to another using a programming language processor. It translates a program written in source code to machine code. During translation, it detects and identifies errors. It converts a high-level language program into a machine language program that can be understood by the central processing unit (CPU). It also checks for programme errors.

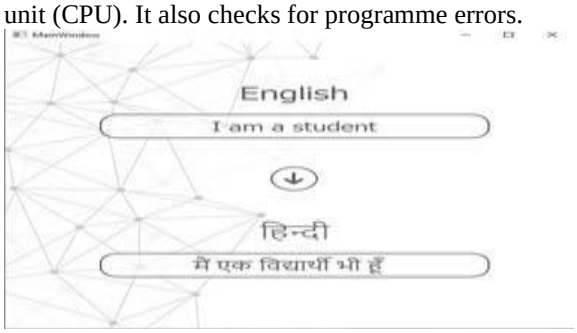

Fig. 6. Second Translation from English to Hindi

Fig. 7. Third Translation from English to Hindi

V. Conclusion

Speech recognition applications have become increasingly more complicated and precise during the last few years. This study delves into the most recent advances in intelligent vision and speech algorithms, as well as their applications on the most popular smart phones and embedded platforms, as well as their limits. Despite the enormous increases in success and efficacy made possible by deep learning algorithms, training the machine with other information sources, which is the framework, contributes significantly to the class subject.

VI. Future Scope

This work can be examined in greater detail in order to improve and add new features to the project, and it can be improved further. The new programme does not support a broad vocabulary in order to collect a larger number of samples and maximise productivity [10]. The current edition of the programme only protects a few parts of the notepad, but more places can be protected, and efforts will be made in this direction.

Deep learning approach for vehicle number plate recognition system with image enhancement technique

Amruta Mahtre
Thakur College of Engineering & Technology,Mumbai, India

Abstract— **The number of automobiles and trucks on the road is continually rising, particularlyin direct connection to the emergence of the industrial revolution and the expansion of the economy. Because of the proliferation of motor vehicles, there is a greater potential for the violation of traffic laws, which in turn increases the risk of both unintended collisions and criminal activity on the road. In order to address these problems, a sophisticated traffic monitoring system is required. The intelligent technology has the ability to significantly contribute to traffic management via the recognition of licence plates. As part of this work, we use convolutional neural networks (CNNs) based Alexnet and MobileNetV2 framework, a subset of the deep learning technology known as convolutional neural networks, to build a system forthe automatic identification and recognition of licence plates. We also propose to improve both the frameworks by applying image enhancement techniques. Both the detection and identificationof licence plates are integral parts of this system. A digital camera is used to capture the imageof the vehicle during the detection phase. The Alexnet and MobileNetV2 framework then isolates only the licence plate from the whole image. After the licence plate number region has been *removed, the low-resolution image is converted into a high-quality one by a process called super resolution. The convolutional layer of a CNN is used in conjunction with a super resolution technique to restore the original image's pixel quality. To separate the characters of a licence plate number, we employ a bounding box method. Features are extracted and labelled using the CNN technique during the recognition stage.***

***Keywords*— CNN, Alexnet, MobileNetV2, recognition, detection, convolutional.**

I. INTRODUCTION

Manually directing and monitoring traffic in an urban environment with an increasing number of vehicles is not only challenging, but also time-consuming, costly, and prone to mistake. It could even be impossible sometimes. As a result, research on automatic licence plate recognition reliable means to identify a specific car, ALR has several practical uses. Traffic management, ticketing offenders, speed estimate, self- driving cars, and surveillance are just However, distributed solar power plants have several operational and maintenance challenges due to their small size, dispersed deployment, and high component density. The main challenges are as follows: There is no mature and effective operation maintenance system. The power inspection is labor-intensive but ineffective; the fault alarm's fault identification capability is poor, frequently necessitating secondary identification by personnel; locating damaged parts is difficult, lengthening the operation and maintenance cycle and increasing labor costs; the power loss analysis is insufficient, leaving the operation and maintenance without guidance; and there is no mature and productive operation maintenance system.

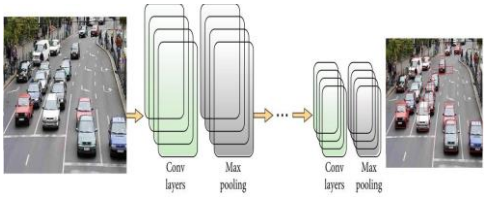
According to projections, photovoltaic (PV) problems such as soiling, shading, deterioration, and short circuit faultsreduce solar array power efficiency by 22.34% to 27.58%. Several machine learning (ML) methods have been used to study the detection of solar defects, with most contemporaryalgorithms depending on a deep neural network solution.

vast network of surveillance cameras has been installed throughout the country's towns, roads, and highways, as well as at its borders, parking lots, and other secure locations, to keep track of vehicles with greater accuracy[2]. Pictures taken by these cameras of passing vehicles aremonitored continuously. It is difficult to find automobiles and identify licence plates without firstprocessing and analysing these photos.

Image processing and machine learning are needed to create a system that can identify vehicles and pull out further information, such as licence plate numbers[3]. The speed and reliability of licence plate recognition systems are closely related to the quality of the images used to make the recognitions. Environmental and climatic conditions such as light projection angle, light intensity, rain, fog, dust, humidity, darkness, glare, occlusion, precipitation, tilt, and blurriness may all have an impact on the quality of the collected images[4].

Detecting vehicle number plates in an efficient manner has been approached from a number of different angles. In order to improve the speed at which this step is completed as well as its overall efficiency, "denoising" and "quality-enhancing preprocessing" operations are carried out. The next step involves positioning the plates shown in the image that has been provided[5-9]. Recent research on plate identification has led to the categorization of existing approaches into the following five main groups: edge-based methods, color-based methods, texture-analysismethods, methods based on image global properties, and hybrid methods. In every one of these domains, machine vision and image processing have been implemented in a variety of guises [10-16]. The segmentation of the plate comes next in this procedure. The binary form is used in the first stage of processing the picture

of the observed plate. The methods of morphology [17], the linked component analysis algorithm [18], and histogram-based methodologies are then used in order to extract the character-related components. This stage is troublesome since the majority of binarization algorithms can only provide adequate results on plates that are completely free of spots. When these procedures are carried out on plates that are not clean, considerable portionsof the information are discarded. To be more exact, the sections of the plate that are designated as character parts are not always always labelled as character parts, and vice versa[19].



II. LITERATURE SURVEY:

Using Hough Lines and Matching Template Models,[20] created a complete licence plate identification and recognition system with a primary emphasis on Hough Transformation. The canny detector was used to perform the investigation, and the accuracy rate for the extraction of vehicle licence plates was 95.67 percent. New Extreme Learning Method (ELM) recognition software was created[21]. The Thai licence plate was used for the purposes of preprocessing and extracting features by using the ELM classifier and the Histogram of oriented Gradients (HOG). With an accuracy of 91.26 percent, the system was able to detect licence plates that included both the identification number of the automobile registration as well as the province. In their vast network of surveillance cameras has been installed throughout the country's towns, roads, and highways, as well as at its borders, parking lots, and other secure locations, to keep track of vehicles with greater accuracy[2]. Pictures taken by these cameras of passing vehicles aremonitored continuously. It is difficult to find automobiles and identify licence plates without first processing and analysing these photos.

To be more exact, the sections of the plate that are designated as character parts are not always always labelled as character parts, and vice versa[19]. paper [22], introduced a unique hierarchical character recognition system that centred on supervised K-means and SVM in order to recognise licence plates that were blurry and slanted. This system attained an accuracy of 96.75 percent when compared to the state-of-the-art techniques to plate identification, which is an average rise of 4.5 percent higher than those approaches23.

Real-time applications benefit from beginning with vehicle detection for a higher detection rate. When searching for a plate, traditional deep learning-based algorithms often examine the whole image. The current method is time-consuming due to the fact that plates make up such a minute percentage of a frame. To save time analysing irrelevant areas of the picture, the suggested technique begins with vehicle detection. Taking this measure saves time and effort by reducing the number of repetitions required to complete the procedure. Multiple convolutional layers of a deep network are used to identify vehicles.

III. PROPOSED METHODOLOGY

When there are a large number of plates present in the frame that is being processed, the majorityof techniques for plate identification are unable to detect all of the plates. This renders these approaches inapplicable for use non real-time scenarios, when there may be a large number of plates in each frame and the amount of time available for reaction may be restricted. In order to solve this problem, the suggested method Alexnet and MobileNetV2, which boosts the processing performance to a level that enables real-time licence plate identification. The initial step of the proposed strategy is the detection of automobiles. After that, based on the architectureof deep learning, plates are first recognised, and then the text of the plates is extracted using a deep network that consists of both convolutional layers and recurrent layers. This process takes place in two stages. The solution that has been suggested is an end-to-end system that can concurrently detect cars and licence plates and identify the plates. The many stages of this process are broken down into their respective parts below**.**

a. Steps of Number plate recognition:

First, the ANPR camera takes still photos or movies that include one or more licence plates. Thismay be done either individually or in groups (video stream or photo). It is feasible to utilise ANPR at any time of the day because to the widespread usage of infrared illumination, which enables cameras to read the licence plates of passing vehicles even after the sun has set.

Detect and crop number plate: In the picture, the licence plate was found using machine learning and computer vision techniques. This was followed by the number plate being cropped. Thereare a variety of approaches, each of which varies considerably from the others in terms of the amount of computer resources required, level of complexity, amount of time required, and degree of precision. Using object detection to identify the cars first and then locating the licence plate inside the bounding boxes generated is a frequent approach. In most cases, this may be accomplished by searching for regions of contrast between the backdrop and the numberplate. Following the successful recognition of the licence plate, the image is further cropped and normalised (sharpened, distorted, and enhanced).

The next step is to apply OCR software to the identified plate region in order to retrieve the licence plate number in text format. This allows the number to be extracted and read. The OCR

software may be customised to work with a variety of character sets, which enables the ANPR system to be used in several countries without modification. The output of an ANPR system is normally the number of the licence plate, often accompanied by the area or nation.

Use the information from the licence plate Once the information has been transformed into plain text format, the licence plate number of the vehicle is saved in a database so that it may be integrated with other IT systems. The licence plate may be compared to a database of registered plates, whitelist and blacklist databases, or both

The constructed convolutional network extracts high-level characteristics for use in vehicledetection. The suggested technique really utilises a combination of high-level data retrieved by a convolutional and recurrent network and low-level features in the main convolutional layer to identify automobiles. In addition, many layers are used to extract distinct features from input photos. Features are retrieved with varying degrees of precision between layers due to the varying sizes of the kernels used. This aids in having pictures rich in detail, allowing for the extraction of useful and distinguishing elements. As shown in Figure 1, the proposed design includes components for identifying the presence of vehicles.

characteristics for use in vehicledetection. The suggested technique really utilises a combination of high-level data retrieved by a convolutional and recurrent network and low-level features in the main convolutional layer to identify automobiles. In addition, many layers are used to extract distinct features from input photos. Features are retrieved with varying degrees of precision between layers due to the varying sizes of the kernels used. This aids in having pictures rich in detail, allowing for the extraction of useful and distinguishing elements. As shown in Figure 1, In order to investigate the ANPR system using a deep learning strategy, [24] employed the first CNN model for licence plate identification and pre-processing methods to identify licence plates and nonlicense plates. The classification and identification tasks were carried out with theassistance of the second CNN model. The investigation was conducted using a tensorflowarchitecture, and it made use of 45 different classes of the second CNN model. Following this,[25] solve this problem, the suggested method Alexnet and MobileNetV2, which boosts the processing performance to a level that enables real-time licence plate identification. The initial step of the proposed strategy is the detection of automobiles. After that, based on the architectureof deep learning, plates are first recognised, and then the text of the plates is extracted using a deep network that consists of both convolutional layers and recurrent layers. This process takes place in two stages. The solution that has been suggested is an end-to-end system that can concurrently detect cars and licence plates and identify the plates. The many stages of this process are broken down into their respective parts below**.**

Alexnet features eight layers with trainable parameters. There are a total of five layers in the model, with Relu

activation used in all except the final output layer. The first two levels makeuse of max pooling, followed by three fully connected layers.

Researchers discovered that by using the relu as an activation function, training durations might be cut by as much as a factor of six. Because of their usage of dropout layers, their model wasnot overfit. In addition, the Imagenet dataset is used for training the model. Almost 14 million photos from 1,000 different types may be found in the Imagenet collection.

IV. III MobileNetV2 Model

MobileNetV2 is an attempt to design a convolutional neural network that can function effectively on mobile devices. It is predicated on a backwards residual structure, with the bottleneck layers acting as the links between the residual layers. A source of non-linearity is filtered out in the intermediate expansion layer by use of light-weight depthwise convolutions applied to features. To summarise, MobileNetV2's architecture is made up of a 32-filter fully convolutional first layer, followed by 19 layers of residual bottlenecks.

Because of its generic design, MobileNetV2 may be used to a wide variety of scenarios. It has a wide range of input layer sizes and width factors to choose from. As a result, the inference cost for mobile devices may be lowered by using a model with a different width. MobileNetV2 is almost identical to the original, except that it makes use of inverted residual blocks and bottlenecking characteristics. When compared to the original MobileNet, it has a much less number of parameters. MobileNets accept inputs of any size above 32x32, and the performance improves with bigger images.

V. CONCLUSION

Five convolutional layers, three max-pooling layers, two fully connected layers, and one Softmax layer made up MobileNetV2. Convolutional filters and the nonlinear activation functionReLU were used in each convolutional layer. Maximum pooling was accomplished with the aid of the pooling layers. There were 96 filters in the first

Although the findings are encouraging, training the most advanced deep learning algorithms is data intensive and requires large annotated data sets. It is often required to at least partly re-collect these enormous datasets since they could be unique for each PV solar installation and location. The expense of collecting and labeling such enormous datasets is high. In this study, we develop and demonstrate a novel fault identification method that requires significantly fewer labeled training samples. This method uses a family of more recent semi-supervised positive unlabeled learning approaches, which, to our knowledge, Conclusion

Fault Recognition in Solar Panels using Machine Learning Algorithms

Ravindra Sonavane, Swati Mude
Thakur college of engineering & technology Mumbai, India
ravi.mergit16@gmail.com, swatimude@tcetmumbai.in

Abstract— **The growing use of solar panels worldwide highlights the need to detect defects in systems based on solar panels. A machine-learning model was developed in this work using past solar panel power output (kWh) and weather information to forecast the future power output of a solar panel system. Researchers might establish if the technology was inefficient by comparing the expected and actual power outputs. Consequently, the system may find all problems if assessed over two weeks while simulating a collapse. These results demonstrate how a machine learning algorithm can replicate a solar panel system's anticipated output and determine if it generates the appropriate amount of power. Adding more meteorological data, improving the quality of the current meteorological data, and training the machine learning model on new data are some approaches for strengthening the system.**

Keywords—GB, KNN, Machine learning, Solar panel, SVM

I. INTRODUCTION

Countries all around the globe have developed an interest in energy-related issues since the turn of the twenty-first century. On the one hand, owing to the sharp rise in demand for chemical fuels like oil, coal, and natural gas, people are beginning to consider resource issues when planning for future sustainable development. On the other hand, the global community is paying more and more attention to how human activity affects climate change. Distributed photovoltaics (DPT), a new energy technology, may be utilized to meet energy needs while reducing greenhouse gas emissions and improving power supply reliability. The distributed photovoltaic power plant is a possible essential solution to the world's energy issues.

However, distributed solar power plants have several operational and maintenance challenges due to their small size, dispersed deployment, and high component density. The main challenges are as follows: There is no mature and effective operation maintenance system. The power inspection is labor-intensive but ineffective; the fault alarm's fault identification capability is poor, frequently necessitating secondary identification by personnel; locating damaged parts is difficult, lengthening the operation and maintenance cycle and increasing labor costs; the power loss analysis is insufficient, leaving the operation and maintenance without guidance; and there is no mature and productive operation maintenance system.

According to projections, photovoltaic (PV) problems such as soiling, shading, deterioration, and short circuit faults reduce solar array power efficiency by 22.34% to 27.58%. Several machine learning (ML) methods have been used to study the detection of solar defects, with most contemporary algorithms depending on a deep neural network solution.

Although the findings are encouraging, training the most advanced deep learning algorithms is data intensive and requires large annotated data sets. It is often required to at least partly re-collect these enormous datasets since they could be unique for each PV solar installation and location. The expense of collecting and labeling such enormous datasets is high. In this study, we develop and demonstrate a novel fault identification method that requires significantly fewer labeled training samples. This method uses a family of more recent semi-supervised positive unlabeled learning approaches, which, to our knowledge, have never been used for PV fault detection. Some labeled data is included in standard semi-supervised learning systems, but more unlabeled input is used to enhance the models. Semi- supervised algorithms have lately been utilized to identify PV failures for the above causes. However, as the production and usage of solar panels develop, it is essential to understand how they deteriorate so that proper action may be taken before they fail. Failure to recognize this degradation may result in several problems, including diminished solar panel performance and, in severe cases, catastrophic failure [1]. As solar panels become more sophisticated in their production and usage, it is critical to understand how they age so that appropriate action may be taken before they fail. Failure to notice this deterioration may lead to several issues, including a decline in solar panel efficiency and, in rare situations, a fatal failure [1].

Photovoltaic (PV) modules, usually referred to as solar panels, have shown exponential growth in usage worldwide during the last ten years [2]. The weather [3, dirt on the panels [4, etc.]] dramatically impacts how well a PV module system performs. The owner does not influence some of the natural factors that impact the PV modules' energy production, such as the sun's angle, clouds, and other weather-related difficulties. A property owner may stop many kinds of reductions in energy output. These were incidents when a PV module failed, and leaves covered the panels or other similar occurrences. This study aimed to develop a software-based solar system fault detection system to recognize such reductions.

Significant performance decreases, or defects, in a PV system were discovered using the historical energy output of the system and climate data. Near the PV system, meteorological data is gathered geographically and historically. In this study, the power output of a PV system will be referred to as energy output and measured in kWh over a predetermined time frame (for example, an hour). Afterward, a machine-learning model was created to predict the anticipated power production of a PV system using the

power output and meteorological data. The fault detection system compares the anticipated or forecast power output to the actual power generation to determine if the PV system is malfunctioning. Because this kind of fault

detection system may be used remotely, locating and diagnosing a defective PV system will be simple. As a result, necessary upkeep or repairs could be finished quicker, producing more energy.

The objective was to use machine learning to build a fault detection system to find defects in PV systems using historical power output and meteorological data. Three factors, however—the degree of power decrease, the threshold, and the time horizon—affect the system's detecting range. When tested over two weeks after the generation of a failure (a 50% loss in power output), the fault detection system was shown to be capable of identifying all problems. On the other hand, reducing the number of mistakes simulated, the time horizon, or the threshold may have a detrimental effect on the result.

In this research, we presented a machine learning-based method for defect identification in solar panels. The system would determine whether or not the solar panel is defective based on its parameters. To categorize the solar parameters in this system, we want to employ SVM, KNN, and Gradient Boosting (GB) algorithms. The machine learning algorithm uses the parameters of the solar panel.

II. LITERATURE SURVEY

Researchers Radu Platon et al. [1] have created machine learning methods to detect inaccurate data. A solar plant's daily mean power consumption was predicted using machine learning regression approaches by researchers Jacques Martel, Radu Platon, Norris Woodruff, and Tak Y. Chau. The system they used could be implemented without needing additional hardware. To predict future readings, it just looks at historical data reading records. As a result, cost- effectiveness rises while supporting evaluations of the profitability of solar farms and preventive maintenance.

S.M. Patil et al. [2] refer to the online visualization of solar energy use as renewable energy. The Raspberry Pi and flask frameworks are used for this monitoring. Intelligent monitoring shows how much renewable energy is used each day. This helps the user examine energy consumption, the impacts of employing renewable energy sources, and power- related concerns.

An innovative method of defect detection and classification within the sensor node is presented by Ali Al- Dahoud [3]. The node contains the proposed fuzzy logic controller-based classifier. The WSN nodes have the correct sensors for the most frequent problems with solar panels. The distribution of nodes has been modeled, and work has been done to build a node with appropriate sensors that take processing fault priority into account. The main simulation results support rapid fault identification with little data processing and transfer.

Patrick Juvet Gnetchejo et al. [4] recommended a simple and dependable multivariate statistical analysis method for identifying and diagnosing PV system flaws. This approach is based on the kernel principal component analysis methodology, which examines and assesses the variance

between these data. It uses the vast amount of data gathered about a PV system that is now in use or readily available on most modern inverters. This research distinguishes the six operational states of a PV system: regular operation, shorted panels, open circuit panels, partly shaded panels, serial resistance drop, and MPPT error. It combines the Hotelling statistic and SPE index, which are connected by Rolle's theorem (T2). Two hundred samples with different flaws have been created at irradiances ranging from 50 to 500 w/m2. Series resistance degradation accuracy was 64%, partial shading accuracy was 91.11%, and open circuit, short circuit, and MPPT error accuracy was 100%. The various outcomes produced first from a Matlab-Simulink model and later from an existing system with 18 modules show how beneficial and effective the suggested approaches are.

V. S. B. Kurukuru et al. [5] provide thermography and machine learning-based PV module fault classification. An altered form of texture feature analysis is used to examine the properties of different thermal images taken from damaged panels. An artificial neural network classifier is trained to build the defect classifier using the collected characteristics. The developed technique demonstrated a training efficiency of 93.4% and a testing efficiency of 91.7% compared to conventional classification methodologies.

Vishal R. Shinde et al. [6] are looking for possible data faults in a solar energy facility. Failures in solar power plants may cost an organization money, which is why they are such an issue. To find these data problems, the system continually examines and assesses the feed from the solar data recorder and any other pertinent information accessible on the plant site. Numerous factors, such as inverter failure, cable damage, and tree shade, might result in data mistakes. This system detects data inaccuracies using machine learning and alerts the user. Additionally, users can prevent or reduce any system damage thanks to this.

Barun Basnet et al. [7] offer an intelligent fault diagnosis approach to recognize and classify defects in PV systems. Over the winter, numerous datasets representing fault and normal states are obtained under varied climatic conditions for experimental verification. The gathered datasets are standardized and preprocessed using various data mining techniques before being fed to a probabilistic neural network (PNN). The PNN model will be trained using previous data to predict and classify issues before importing new data. The trained model outperformed other machine learning classification approaches regarding prediction accuracy.

According to Michael Oberdorf et al., renewable energy sources are displacing traditional power production methods using fossil fuels [8]. Today, renewable energy includes solar energy. However, power generation efficiency is still poor, calling for the implementation of reliable fault detection methods. Machine learning techniques like neural networks may be used. These networks provide predictions about the output quality based on inputs like current, voltage, temperature, and climatic data. The network must be trained on faulty and non-defective data to achieve this.

III. PROPOSED SYSTEM

Fig. 3.1 displays the suggested system's block diagram. Figure 1 shows the research project's block architecture so that the suggested work may be understood more clearly. The system's three parts are data gathering, preprocessing, and fault detection. The Data Gathering module of the system is the first one. Here, the system gathers

meteorological data and mixes it with details on a particular PV system. A different file for each PV system contains the supporting meteorological data for each data point. After that, the produced file is sent to the Data Preprocessing module. Each system module is explained in great depth below.

A. Data gathering for solar panel parameters

The solar panel fault detection dataset is created using the online dataset. You may get the dataset at https://data.mendeley.com. Laboratory experiments of PV microgrid system faults are used to collect information on grid-connected PV system failures (GPVS faults). There are 16 data files—16 ". mat" files and 16 "CSV" files detailing severe defects in the solar panels, inverters, grid anomalies, feedback sensors, and MPPT controllers, each representing a distinct scenario for the experiment. PVS-Faults data may be employed to develop, verify, and assess various fault detection, diagnosis, and classification algorithms for reactive maintenance and PV system protection. The system to crash and cease operations. There are the following columns in each data file: Time: Time in seconds, average sampling Ts=9.9989 μs.

Ipv: PV array current measurement. Vpv: PV array voltage measurement. Vdc: DC voltage measurement.

Ia, Ib, Ic: 3-Phase current measurements. Va, Vb, Vc: 3-Phase voltage measurements. Iabc: Current magnitude.

If: Current frequency Vabc: Voltage magnitude. Vf: Voltage frequency.

B. Data Preprocessing

The Data Preprocessing module is mainly in charge of two tasks. The information gathered by the Data Gathering module must first be cleansed. Cleaning data involves identifying and correcting inaccurate information. New features should be added after being created for the data set. "Constructing features" refers to repurposing already- existing features. After completing these steps, the data may now be utilized in the Fault Detection module. Normalization is a scaling method that adjusts and rescales data such that it is between the ranges of 0 and 1. They also referred to the Min-Max scaling in Eq experiments included the manual introduction of the mistakes.

$$X' = \frac{X - X_{min}}{X_{max} - X_{min}}$$

Standardization, which centers data around the mean and has a single standard deviation, is another scaling technique. As a result, the distribution's standard deviation equals one, and the attribute's mean becomes zero. It is provided by

$$X' = \frac{X - \mu}{\sigma}$$

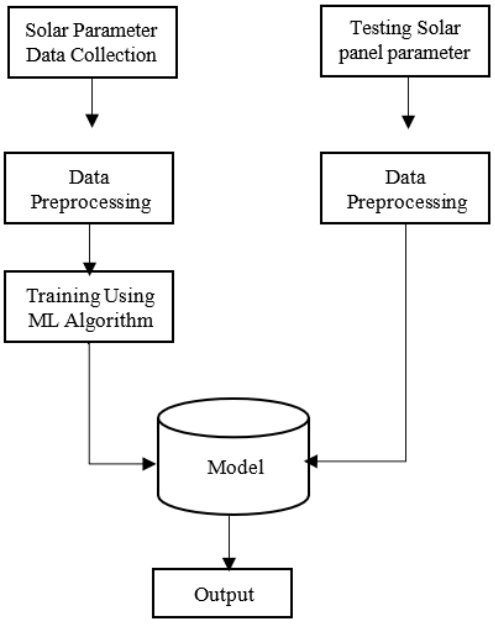

Fig. 1. Block diagram of Fault Detection AI For Solar Panels

The high-frequency data are noisy and sensitive to disturbances, temperature changes, and insolation during and between the tests, which has a detrimental influence on the detection of low-magnitude defects in the MPPT/IPPT modes. Finding the weaknesses before they cause a complete failure is a problem since serious errors might cause the

C. Training and Testing using a Machine learning model

The recommended strategy uses machine learning to address the classification problem. The decision tree (DT), K Nearest Neighbor (KNN), and Support Vector Machine (SVM) algorithms are used by the system to classify the input PV parameters as faulty or normal. The machine learning algorithm is thoroughly explained in the section that follows.

a. Support Vector Machine

The SVM algorithm was invented for the first time by Vapnik and Lerner in 1963. The SVM is a binary classifier that performs better than other classifiers. Based on supervised learning, it operates

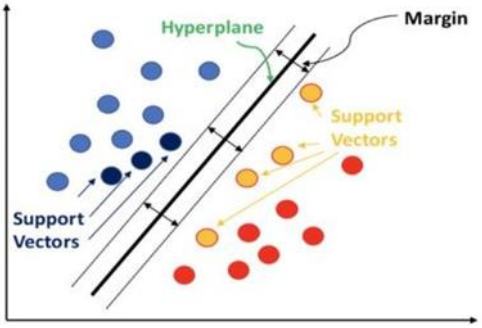

Fig. 2. Linear SVM

SVM divides the world into two groups by creating a hyper- plane in a high-dimensional feature space that may be utilized for classification. SVM is a classification method built on several kernel approaches. SVM is separated into two groups. A support Vector Machine

(SVM) is a collection of non- linear processes concerned with the morphology or form of data features.

b. K Nearest Neighbor

One of the most straightforward classification methods for supervised learning is KNN. In feature space, the goal is to find the test data that matches it most closely. We'll investigate it using Fig. 3.

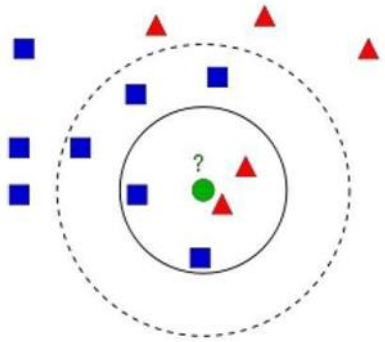

Fig. 3. KNN algorithm

The image shows two families, Blue Squares and Red Triangles. The term "class" refers to each family. On the feature space of their town map, their residences are shown. Since then, a newcomer to the neighborhood has moved in and constructed a new home symbolized by a green circle. One of these Blue/Red families should include him. Classification is the name given to that technique. What do we do? Let's use this algorithm while using KNN. Finding out who his nearest neighbors are is one strategy. It is clear from the image that the family is from the Red Triangle. Therefore, he is a part of the Red Triangle. This strategy is known as the nearest neighbor classification since it only considers the closest neighbors. There is a problem with it, however. Red Triangle may be the closest. But what if there are a lot of Blue Squares nearby? In such circumstances, Blue Squares in that region are more powerful than Red Triangles. Therefore, just checking the nearest is insufficient. Instead, we looked at the k nearest families. Then whoever constitutes the majority of them is the owner of the new guy. In our case, think about the three nearby households, or k=3. He has two Reds and one Blue (although there are two Blues close by, we only chose one since k=3). He ought to be re-added to the Red family as a result. However, what if k is assumed to be 7? He then has two Red families and five Blue families after that. Great!! He should now be a part of the Blue clan. The value of k impacts everything. What happens if k = 4 is the most amusing situation. There are two Red and two Blue neighbors nearby. It's a tie. So it makes sense to think of k as an odd number. This method is known as k-Nearest Neighbor since classification relies on k-nearest neighbors. After training, machine learning models are stored in the system. For Testing, the model that has been stored is used.

c. Gradient Boosting

One kind of machine learning boosting is gradient boosting. It is predicated on the hypothesis that the total prediction error is reduced when prior models are coupled with the most promising upcoming model. It is essential to indicate the anticipated results for the subsequent model to reduce mistakes. How are the goals selected? The degree to which modifying a case's prognosis affects the overall prediction inaccuracy determines the objective result for each instance:

- A high-value case outcome is when a prognosis for a particular instance is somewhat altered, and the degree of accuracy is considerably reduced. New model predictions that are near their goals will reduce inaccuracy.
- If a modest change to the prediction has no impact on the mistake, the case's subsequent target result is zero. There is no way to improve the accuracy of this prediction.
- This method is known as "gradient boosting" because target outcomes are determined for each instance based on the gradient of the prediction's unreliability. With each successive model, the range of potential predictions for each training instance is progressively narrowed.

IV. RESULTS

This technique uses Mendeley Data, an online source [9], to get the dataset. Information on Grid-connected PV System Faults (GPVS faults) is gathered via testing faults in a PV microgrid system in a lab. Each of the 16 data files—16 ". mat" files and 16 ".csv" files—represents a distinct scenario for the experiment and provides information on variably severe defects in the solar panels, inverters, grid anomalies, feedback sensors, and MPPT controllers. GPVS-Faults data may be used to develop, validate, and evaluate various fault detection, diagnosis, and classification algorithms for reactive maintenance and PV system protection.

The experiments included the manual introduction of the mistakes. The MPPT/IPPT modes, noisy high-frequency data, pause, and variations in temperature and insolation during and between Testing make it challenging to identify low-magnitude faults. Finding the weaknesses before they cause a complete failure is a problem since serious errors might cause the system to crash and cease operations. The example dataset is shown in Fig. 4.

The Data Preprocessing module is mainly in charge of two tasks. The information gathered by the Data Gathering module must first be cleansed. Cleaning data involves identifying and correcting inaccurate information. New features should be added after being created for the data set. "Constructing features" refers to repurposing already- existing features. After completing these steps, the data may now be utilized in the Fault Detection module. With this approach, data are normalized and standardized. The results of the preprocessing are shown in Fig. 5.

Fig. 4. Fig.4. Database sample

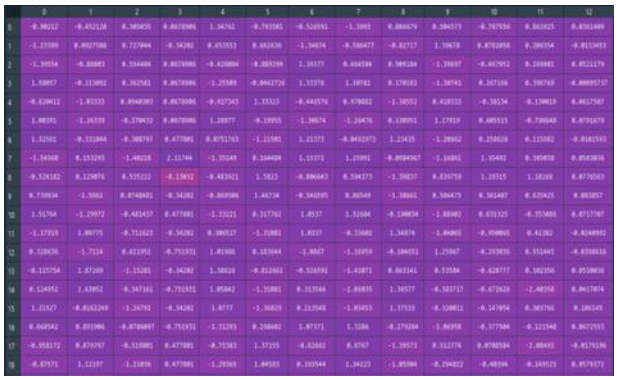

Fig. 5. Fig.5. Preprocessed Data

The training accuracy of the proposed system is tabulated in Table I.

Algorithm	*Parameters*	*Training*
SVM	Kernel = rbf	0.60875
	Kernel = poly	0.70575
	Kernel = sigmoid	0.17141666666666666
KNN	K=3	0.8936666666666667
	K=5	0.88425
	K=7	0.8766666666666667
Gradient Boosting	-	0.99525

From TABLE I, it is observed that gradient boosting and KNN algorithms performed satisfactorily. The Gradient boosting algorithm outperforms all the algorithms used for the analysis because of the ensemble methods used in the gradient boosting. It is a combination of gradient descent and the AdaBoost algorithm.

V. CONCLUSION

The research aimed to create a system that can detect PV system flaws using meteorological data and machine learning. This was accomplished by developing a PV system's anticipated output and contrasting it with its actual output. Identifying problems and breakdowns as soon as feasible is essential for the effectiveness and safety of PV systems. PV systems may have many flaws and problems. Data is utilized for training machine learning (ML)-based fault detection models, which result in exceptionally accurate predictions. However, if environmental elements are ignored, data-based problem detection algorithms for PV systems may result in incorrect projections. This method uses SVM, KNN, and GB algorithms to create an intelligent fault detection model for PV arrays that correctly classifies the defect kinds. A large dataset with various data values collected over the summer and winter seasons under varied environmental circumstances was used to train the model.
